

# Remote Sensing of Lake Dynamics in the Context of Global Change: A Global Perspective

**Yongwei Sheng**

**UCLA Department of Geography**

# Global Lake Distribution from GLWD

- ☑ ~250,000 lakes (>0.1 km<sup>2</sup>)
- ☑ Largest group of lakes:
  - high-latitudes (> 45°N);
- ☑ Second largest:
  - 27 -- 42°N;
- ☑ ... ..
- ☑ Compiled from various sources (1 : 1 to 3M):
  - DCW (1970s to 1990s);
  - Arc World (1992);
  - WCMC Wetlands map -- World Conservation Monitoring Center (1993)
- ☑ Currently best available data sets.

Source: GLWD (Lehner and Doll, 2004)

# Problems of GLWD

- ✓ A good reference:
  - 250k lakes;
  - 2.4 million km<sup>2</sup>;
  - 1.8% density.
- ✓ Miss a lot of small lakes:
- ✓ Not a systematic inventory;
- ✓ Not addressing lake dynamics.

Another global lake estimate (Downing et al, 2006):

- Lake abundance: >300 million lakes;
- Total lake area: 4.6 million km<sup>2</sup>;
- Lake area density: >3%.

# Lake Dynamics

- ☑ Water & energy cycling;
- ☑ “measure, monitor, and forecast the US and global supplies of fresh water.” (OSTP, 2004)
- ☑ Global warming:
  - How much have lakes changed?
  - What are the mechanisms?
  - What are the possible consequences?
- ☑ But, How?
  - Remote Sensing!

# Our Current Critical Regions for Lake Dynamics Remote Sensing

- ☑ West Siberia ( $\sim 0.5$  M km<sup>2</sup>);
- ☑ Pan-Arctic ( $\sim 40$  M km<sup>2</sup>);
- ☑ Tibetan Plateau ( $\sim 1.5$  M km<sup>2</sup>);
- ☑ All remote, under-populated, climate-sensitive.

.

# Local-Scale Arctic Lake Dynamics

☑ Studies have recently used remote sensing, field work, and historical records to examine Arctic/sub-Arctic lakes changes during recent decades:

- *Osterkamp et al., 2000*
- *Jorgenson et al., 2001*
- *Yoshikawa and Hinzman, 2003*
- *Christensen et al., 2004*
- *Payette et al., 2004*
- *Stow et al., 2004*
- *Marsh et al 2005.*

☑ Most of them are done at local scale.

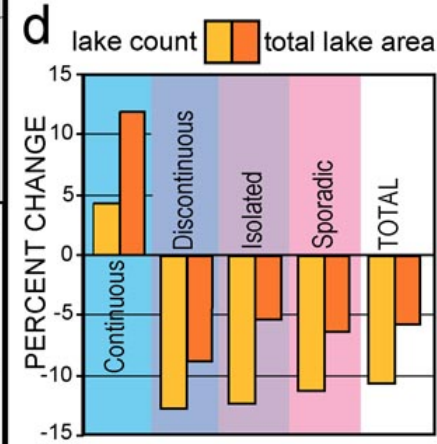

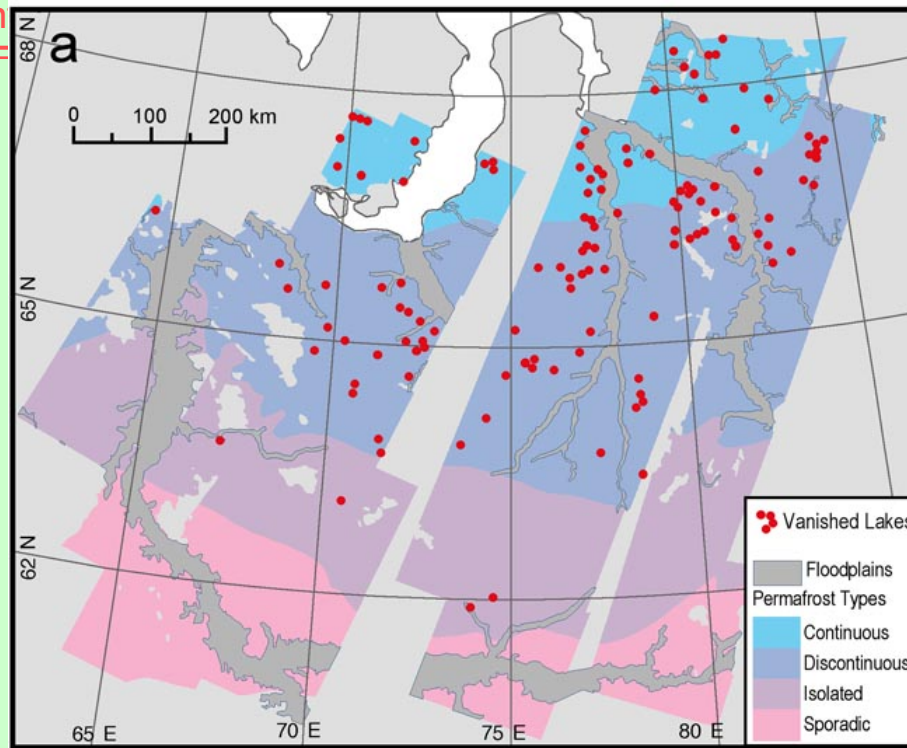

☑ Does lake dynamics exhibit a pattern?

# Regional-scale Lake Dynamics in West Siberia

- ✓ Satellite-based inventory of an area  $> 0.5$  million km<sup>2</sup>.
- ✓ 1973 MSS imagery vs. 1997/98 RESURS imagery.

*Inventory of ~10,000 large Siberian lakes (1973-1998) reveals lake growth in continuous permafrost but disappearance in discontinuous, isolated and sporadic permafrost*

*("Disappearing Arctic Lakes," Smith et al., Science, 2005)*

# Ground Confirmation

*lake expansion  
(northern,  
continuous  
permafrost)*

*lake shrinking further south*

- ☑ 125 disappeared lakes ( $> 0.4 \text{ km}^2$ ) were detected!
- ☑ No new lakes.

# Mechanism for Arctic Disappearing Lakes

## Disappearing Lakes

In summer, ice melts across much of the Arctic, forming thousands of lakes. Under each lake is a layer of permanently frozen ground, or permafrost. When the permafrost melts, the water seeps into the ground.

*Rising Temperature*

# Remote Sensing of Pan-Arctic Lakes

- ☑ *~200,000 lakes (sized 0.1 – 50 km<sup>2</sup>, GLWD) northwards of 45°N*
- ☑ *Regional scale studies:*
  - *5,400 km<sup>2</sup> lake change detection in western Arctic coast of Canada (Marsh et al, 2005);*
  - *34,570 km<sup>2</sup> lake mapping in North Slope of Alaska (Frohn, Hinkel et al, 2005; Hinkel et al, 2007);*
  - *515,000 km<sup>2</sup> lake change detection in West Siberia (Smith, Sheng et al., 2005).*

# Lake Changes at Pan-Arctic Scale

- ☑ 45°N and north:
  - Peak in the global lake distribution;
  - 45°N: about the southern limit of permafrost zones;
  - Coverage:
    - ❖ 73 million km<sup>2</sup>, 1/7 of the Earth's surface;
    - ❖ 41 million km<sup>2</sup> of land, ~1/4 of the Earth's land surface.
- ☑ So far only <2.5% of the high-latitude land surface has been studied for lake change-detection.
- ☑ *“How have northern lakes responded to rising Arctic temperatures?”*
- ☑ Arctic lake changes would have significant ramifications for hydrology, ecology, carbon cycle, and so on.

# Requirements to Arctic Lake Remote Sensing

## ☑ Characteristics of Arctic lakes:

- Abundant in number;
- Small in size;
- Shallow in depth;
- Frozen most of the time;
- Low-relief landscapes.

## ☑ Requirements to remote sensing:

- Many, high-resolution, summer images!
- Pan-Arctic lake mapping requires ~1,800 scenes of cloud-free Landsat images acquired in summer season for each change detection episode.
- Automation!

# Critical Technologies and Automation

- ☑ Precise image co-registration;
- ☑ Accurate lake mapping;
- ☑ Detailed change detection.

# Hierarchical Lake Mapping

- ☑ Global segmentation and local adjustment

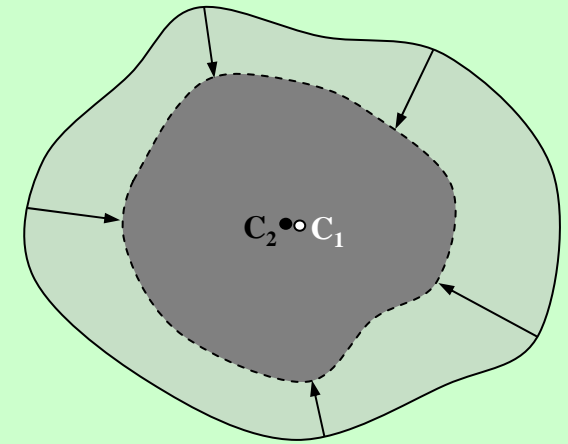

# Automated PIF-based Image Co-registration

MSS: June vs. August, 1973

PIF: pseudo invariant features

RMSE = 0.27 pixel

Before

After

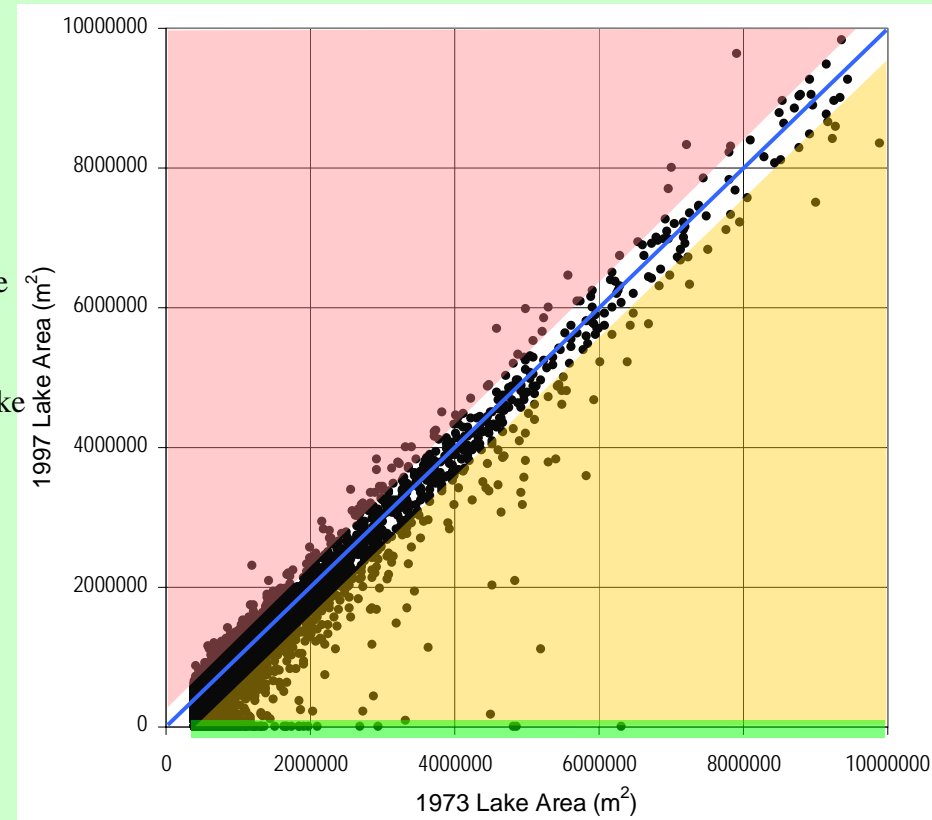

# MSS with TM

# 1974 MSS and 2002 ETM+ (0.24 pixel) Alaskan ACP (70.46°N, 155.25°W)

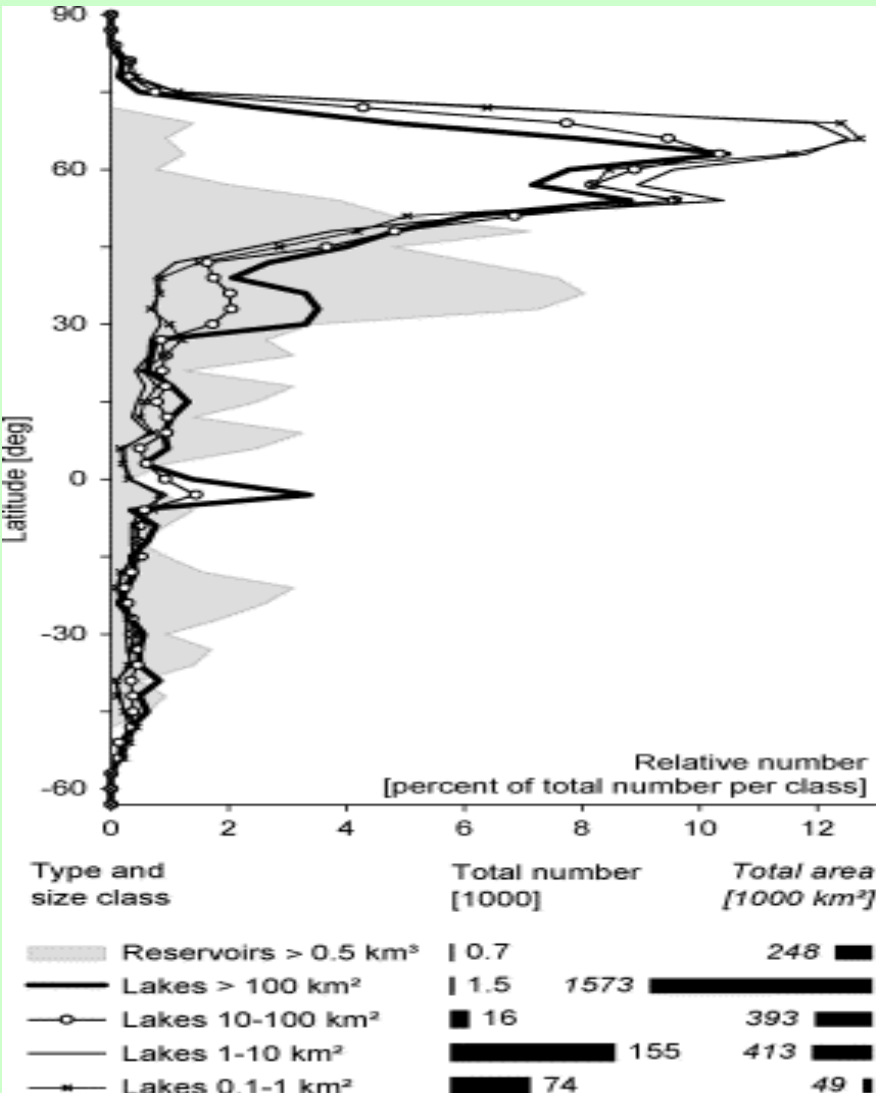

# Multi-Decadal Lake Change Record

# Expected Results from Pan-Arctic Studies

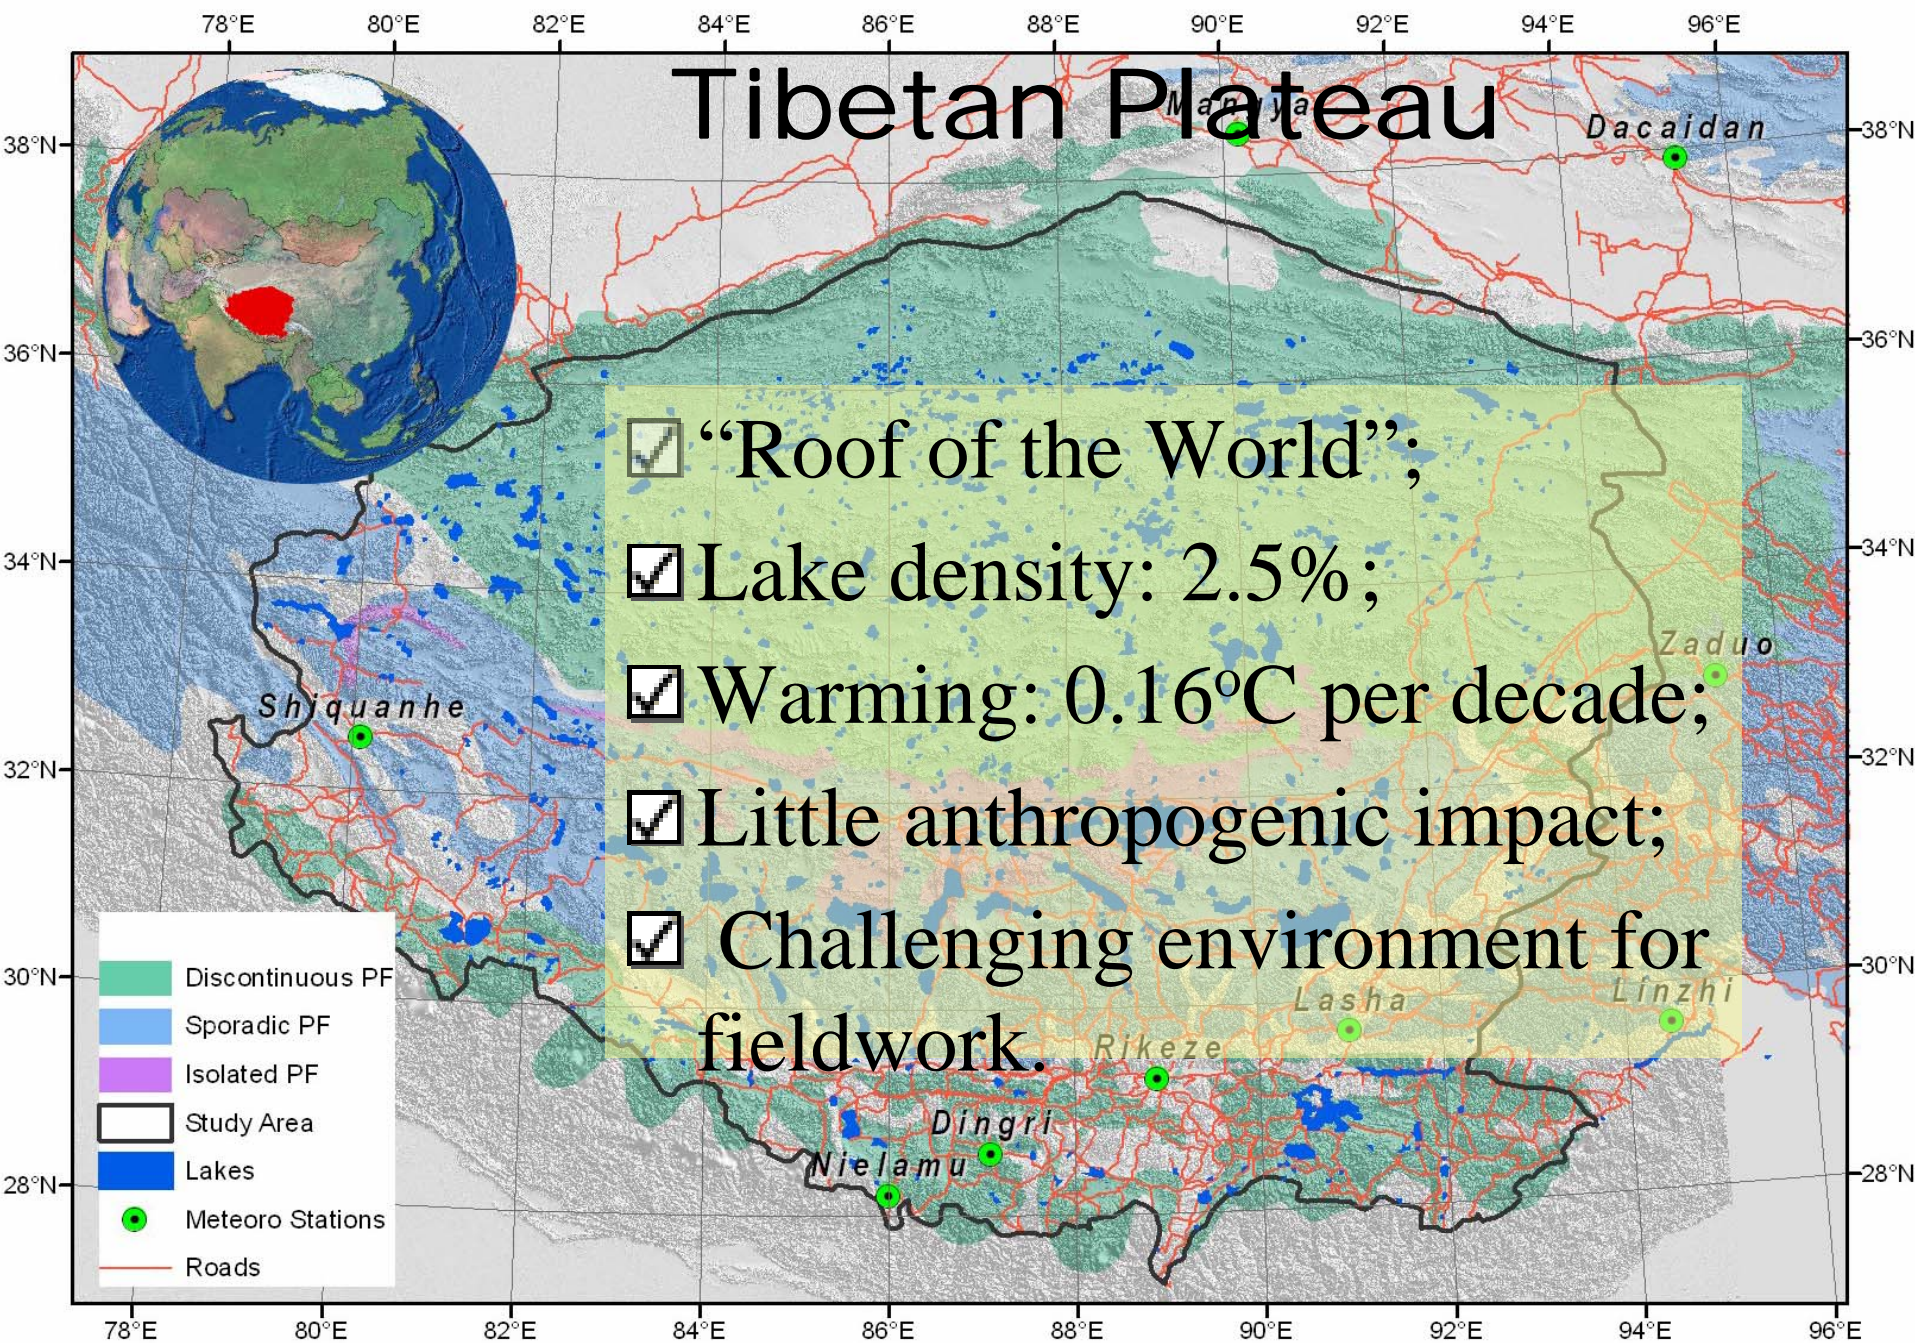

- ☑ Systematic inventory of high-latitude lakes;
- ☑ Metrics on lake dynamics.
- ☑ Science questions and Hypotheses:
  - “How have northern lakes and wetlands responded to rising Arctic temperatures, and what does their future hold with respect to continued warming in the region?”
  - High-latitude lakes are in a disequilibrium state since the 1970’s.
  - Lake changes are significantly influenced by other factors besides climate, such as permafrost state.
  - The ultimate “endgame” for a hotter Arctic is a shift from above-ground to below-ground storage of water.

# Global Lake Distribution

- ☑ Largest group of lakes:
  - high-latitudes;
- ☑ Second largest:
  - 27 -- 42°N
  - Where are they?

Source: GLWD (Lehner and Doll, 2004)

# Science Questions

- How do present-day lake areas compare with maximum lake extents during the GLP period in the late Pleistocene, as evidenced by paleo-shoreline data?**
- How have areas and distributions changed over the past 30 years, an interval of pronounced warming in the region?**
- What are the driving mechanisms underlying the observed lake changes?**

# Remote Sensing of Paleo Lake Changes

- ✓ Greatest Lake Period (GLP): between ~40 and 25 ka BP;
- ✓ Shrunk greatly since then;
- ✓ "How much have the Tibetan lakes shrunk since the late Pleistocene? "
- ✓ Integrated RS/GIS approach.

# Recovered paleo lake extent matching lake features

- ☑ Paleo water level: ~4523 m with a variation of 3 m;
- ☑ Paleo lake extent: ~846 km<sup>2</sup>;
- ☑ Water loss: ~ 30.4 km<sup>3</sup> water;
- ☑ Paleo lake broke into modern Dagze Co and 30+ lakes.

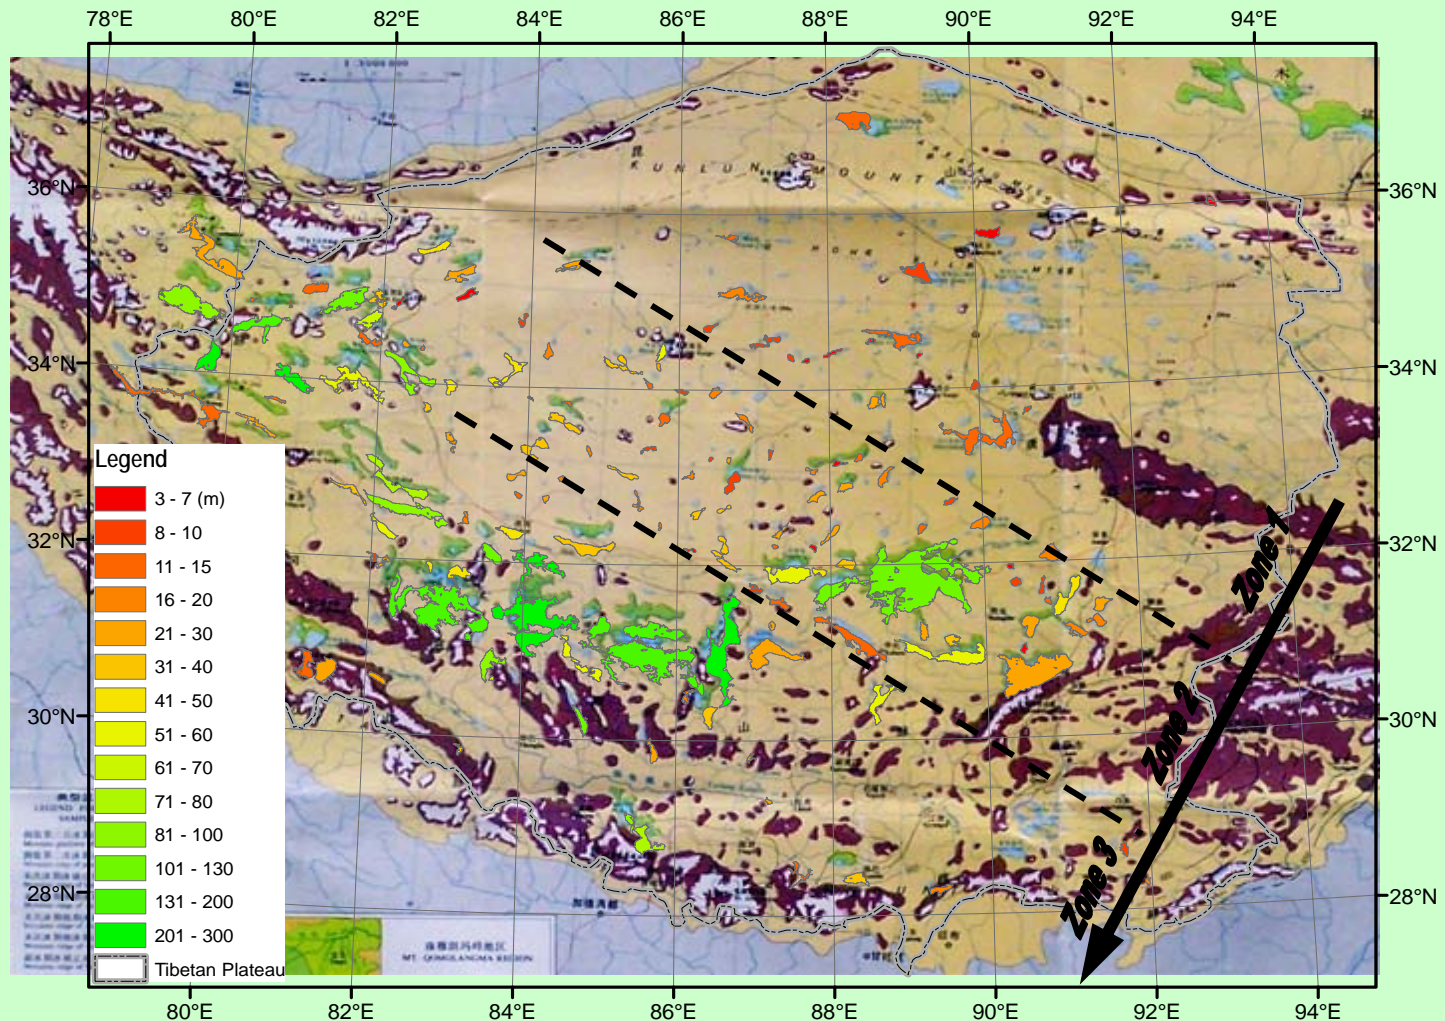

# Paleo Lake Recovery Across the Plateau

- ✓ 653 contemporary lakes evolved from 173 paleo mega lakes.
- ✓ Total area shrinkage and water loss are estimated at 42,109 km<sup>2</sup> and 2,936 km<sup>3</sup>.

# Spatial Pattern of Paleo Lake Change

- ☑ Zone 1: minor water-level drop (<20 meters).
- ☑ Zone 2: the moderate zone, with 20-60 meter water level drop.
- ☑ Zone 3: greatest water-level drop, up to 285 meters.

# Recent Dynamics of Dawa Co

- (a) ETM image of 10/28/2000;
- (b) Lake change between 11/15/1976 MSS and 11/10/1990 TM image;
- (c) Lake change between 10/10/1990 TM and 10/28/2000 ETM+ image.

# Challenges in Global Lake Dynamics

- ☑ Adequate lake change detection:
  - Precise image co-registration at sub-pixel accuracy;
  - Accurate lake identification;
- ☑ Automation:
  - Accurate lake identification and sub-pixel accuracy co-registration;
- ☑ Satellite image acquisition;
- ☑ Addressing seasonal variation;
- ☑ Understanding the mechanism of lake changes.

# Critical Techniques

- ☑ Algorithms have been tested in Arctic and Tibetan Plateau:
  - Image co-registration;
  - Lake identification;
  - Change detection.
  
- ☑ Automation!

# Challenge to satellite image acquisition

*Suitable 1970's Landsat coverage is not comprehensive.*

## Possible Solutions

- ☑ Making a large budget for projects;
- ☑ Calling for institutional attention;
- ☑ Coordinating among researchers;
- ☑ Encouraging data sharing and trading.

# Challenge to addressing seasonal variation

- ☑ Seasonal variation vs. Long-term changes;

## Possible Solutions

- ☑ Narrow the lake mapping episode to the best season;
- ☑ Avoid the snow melting and flood periods;
- ☑ Leave blanks rather than include images in unwanted seasons;
- ☑ Use overlap area of neighboring scenes to quantify seasonal variations.

# Challenge to understanding the mechanism behind lake changes

- ☑ Involved various factors.

## Possible Solutions

- ☑ Collecting various data sources:
  - Topographic data;
  - Environmental data;
  - Hydrological data;
  - Climatological data;
- ☑ Establishing GIS database;
- ☑ Using comprehensive GIS analysis;

<300 m*

*(Ray and Adams, 2001)*

# Conclusions

## Remote sensing of lake dynamics:

- On-going efforts;
- Global-scale;

## A lot of work!

## Acknowledgement:

- NASA THP;
- NSF Arctic Science Program;
- NASA NIP.

An aerial photograph of a wetland or marsh area. The landscape is a mosaic of irregularly shaped blue water bodies and yellowish-brown land. The water bodies vary in size and are interconnected by narrow channels. The land appears to be a mix of mudflats and low-lying vegetation. The overall scene is a complex, textured pattern of water and land.

# Thank You!
