Dear Dr. Andrews:

Raba Kistner Consultants, Inc. (RKCI) is pleased to provide the results of our Property Condition Assessment (PCA), Phase I Environmental Site Assessment (ESA), and Cultural Resources Review of the Institute of Texan Cultures located at 801 East César E. Chávez Boulevard in San Antonio, Texas. This work was authorized on September 22, 2022 and performed in general accordance with the proposed scope of services outlined in RKCI Proposal No. PSR22-055-00, dated July 22, 2022. Approval for this project was received on September 22, 2022. Where financial implications are connected with problem areas observed, opinions of costs for recommended actions are provided. These opinions of costs are separated into Short Term, Long Term, and American Disabilities Act (ADA) categories that comprise recommended and estimated capital replacement reserve requirements over the next 5 years. Representatives from RKCI performed the assessment on September 22, 2022. Mechanical and Electrical assessments were performed by Cleary Zimmerman Engineers (CZ) on September 22, 2022.

This work has been performed under the direction of RKCI’s engineering professionals per the authorized proposal between RKCI and The University of Texas, San Antonio (Client). This report was not completed in accordance with any solicitation for performance of design professional services nor was it intended to be performed in a manner consistent with the design professional registration laws in the state where the subject property is located.

We appreciate the opportunity to provide these services to our Client. If you have any questions concerning this report, or if we can assist you in any other matter, please call (210) 699-9090.

Very truly yours,

RABA KISTNER CONSULTANTS, INC.

Laurie M. Steves, P.E.
Manager, Forensic Services
LMS/KKCV/ls

Kaitlyn K. Vaclavik, P.E.
Structural Engineer, Forensic Services

1.0 EXECUTIVE SUMMARY

A PCA, ESA, and Cultural Resources Review was performed by RKCI on the property located at 801 E. César E. Chávez Boulevard on September 22, 2022. The subject property, constructed circa 1968, is comprised of three stories encompassing approximately 186,000 square feet. The 6.5240 acre property is bound to the east by Interstate Highway 37, to the south by East César E. Chávez Boulevard, to the west by office buildings and the Tower of Americas, and to the north by parking lots and Montana Street. In general, the property is in good condition.

2.0 ASSESSMENT

2.01 SITE VISIT

Representatives of RKCI and CZ performed the scope of work on September 22, 2022. The weather at the time of the observation was sunny and clear. Photographs of the interior and exterior of the building and site are included in Attachment B.

2.02 PROPERTY INFORMATION

**Surrounding Area:** The subject site is bound to the east by Interstate Highway 37, to the south by East César E. Chávez Boulevard, to the west by office buildings and the Tower of Americas, and to the north by parking lots and Montana Street.

**Proximity to Flood Plain:** According to the information provided on Federal Emergency Management Agency (FEMA) NFIP Map No. 48029C0415G, dated September 29, 2010, the subject property is not located within a potential Flood Zone.

**Number of Entry Drives:** Egress/ingress is provided from three access drives. There is one access drive from East César E. Chávez Boulevard and one from Tower of the Americas Way which provide access to car parking areas and building entrances. Access to delivery service drives is located along East César E. Chávez Boulevard. The entrance aprons as well as the car parking areas are paved with asphalt cement pavement. Delivery service drives and loading dock areas are paved with concrete.
Parking Spaces: Values are defined as striped parking spaces.

Based upon local building code requirements, total parking spaces and accessible parking including van accessible spaces do not satisfy the code authority. Per code, the building should have five (5) accessible spaces and two (2) van accessible spaces. There are four (4) spots at the northwest corner of the property that appear to have been accessible parking at one time; however, the marking have been removed from these spots.

Utilities

- **Electric-** Unknown, likely CPS Energy
- **Water-** Unknown, likely SAWS
- **Sanitary Sewer-** Unknown, likely SAWS
- **Gas-** Unknown
- **Telephone-** Unknown

Building Classification Information

- **Occupancy, Group:** N/A
- **Zoning** D (Downtown District)
- **Type of Construction** Unknown
- **Seismic Information:** According to ASCE 7-2016 “Minimum Design Loads and Associated Criteria for Buildings and Other Structures”, this building is classified as Seismic Design Category A, which is a building located in regions having a very small probability of experiencing damaging earthquake effects. There are no specific seismic design requirements but structures are required to have complete lateral-force-resisting systems.
- **Total Building Area:** Area defined as SF of Gross Building Area

2.04 SITE DEVELOPMENT

**General.** The subject property, constructed in 1968, is comprised of one rectangular three-story, concrete framed building with exterior precast walls and window/door fenestrations. The ground floor mainly consists of maintenance and storage rooms with a portion of the floor space occupied by exhibits and displays. The second floor compromises the bulk of the exhibits and displays. The third floor consists of office space and archive storage. The building site includes surface-level parking, exterior houses that serve as exhibits, concrete and asphalt sidewalks, and an amphitheater with a steel-framed canopy. Representative photographs are included in Attachment B.

**Asphalt Surface Pavement.** Asphalt-paved parking surfaces and drives for light duty passenger vehicles are located along three sides of the property. Asphalt pavements are, in general, in fair condition. Signs of light to moderate, localized, cracking, pitting, and rutting were the predominant distresses observed. RKCI also observed some potholes. The cracks and potholes in the pavement surface should be sealed to prevent water infiltration. It is estimated that a seal coat will be required in the Short Term with a re-application in Year 5 of the Long Term. Because the asphalt will be sealed in Short Term, re-striping of the parking areas will also be required following sealing. Given the deteriorated condition of the striping throughout the site, it is recommended that the entire property be re-striped in the Short Term and following each re-sealing of the asphalt. Refer to Photographs 2 through 5.

**Concrete Surface Pavement.** Concrete pavement is located at delivery entrance drives, the loading dock area, and at the accessible parking spaces on the west side of the building. Concrete pavements are in fair condition. Signs of moderate, localized cracking was observed as shown in Photographs 6 through 9. The cracks in the pavement should be sealed in the Short Term to prevent water infiltration which can cause differential movement of the pavement. Joint sealant was also in poor condition. The joint sealant should be replaced in the Short Term to prevent water infiltration through the joints, which can cause differential movement of the pavement.
Parking Garage. N/A

Side Walks.

- Broom-finish and pebble-finish cast-in-place concrete sidewalks are located adjacent to the parking areas on the north, east, and west sides of the property and leading from the service driveway to the ancillary buildings on the southeast side of the property. The concrete sidewalks are in poor to fair condition. Typical distress conditions include cracks, spalls, popped aggregate, and evidence of differential movement in the sidewalks. RKCI observed several locations where differential movement of the sidewalk has caused trip hazards between concrete panels. Sidewalk joint sealants are in poor condition. All cracks and joints should be sealed in the Short Term to prevent water infiltration, which can cause differential movement of the pavement. Trip hazards are considered a life-safety issue and should be repaired in the Short Term. Refer to Photographs 10 through 13.

- A pebble-finish cast-in-place concrete patio is located on the south side of the building. The patio is in fair condition. RKCI observed cracks, spalls, and deteriorated or missing joint sealant. All cracks and joints should be sealed in the Short Term to prevent water infiltration, which can cause differential movement of the pavement. Refer to Photographs 14 and 15.

- An asphalt-paved seating area is located on the west side of the building adjacent to the parking area. This asphalt is in poor condition. RKCI observed full-depth cracks in the asphalt, evidence of differential movement, and trip hazards. Trip hazards are considered a life-safety issue. Refer to Photograph 16. The asphalt pavement in this area should be removed and replaced in the Short Term.

- Asphalt sidewalks are located on the south and north sides of the property and provide walkways between parking areas. In general, the asphalt sidewalks are in poor condition. Typical distress conditions include transverse and longitudinal cracks, edge raveling, and plant growth through the pavement. Cracks should be sealed in the short term to prevent water infiltration. A seal coat should be applied in the Short Term and again in Year 5 of the Long Term. To minimize edge raveling, the Client may consider installing curbs on the outside edge of the sidewalks. Refer to Photographs 17 through 19.

- Granite sidewalks are located adjacent to the building. In general, the granite sidewalks are in fair to good condition. Typical distress conditions include cracks in the granite slabs and differential movement causing trip hazards. Trip hazards are considered a life-safety issue and should be repaired in the Short Term. RKCI observed that most of the distressed granite slabs were adjacent to large trees. The trees are likely contributing to differential movement (settling) because the tree roots will remove moisture from the subsurface soils, causing the soil to shrink. Refer to Photographs 20 through 22. To level the granite sidewalk, RKCI recommends the Client remove the granite slab, add soil as needed and compact the soil, then replace the granite slab. Slabs that are cracked should be replaced in the Short Term.

Steps/Stairs/Retaining Walls.

- RKCI observed granite steps at multiple locations around the perimeter of the building. In general, the granite steps are in good condition. Refer to Photograph 23. On the north side of the building, efflorescence was observed near the top of the stairs, which indicates that water is likely infiltrating the supporting concrete which can cause deterioration over time.

- RKCI also observed railroad-tie steps on the north and east sides of the building. The steps that lead from the loading dock area are in fair condition with some distress to the railroad ties. The steps that extend from the sidewalk to the fence on the north side are in poor condition. These stairs have been roped off because several of the railroad ties have failed. Refer to Photographs 24 and 25. RKCI recommends removing the steps on the north side in the Short Term.
There are granite steps and benches as well as concrete steps and benches in the outdoor amphitheater on the east side of the building. These steps and benches are in good condition. Refer to Photograph 26.

- There is a ramp on the south side of the building which appears to be in good condition.
- Stair railings are typically painted, tube steel sections that appear to be in good condition.

Curbs. Cast-in-place concrete curbs are located along the perimeter of surface parking areas throughout the site. All curbs are constructed with construction joints along their entire length. The curbs are in good condition with cracks in isolated locations. The cracks should be sealed in the Short Term to reduce water infiltration which can cause differential movement of the curbs. Refer to Photograph 27.

Fences. There is a painted, wrought-iron fence around the top of the berm and around the perimeter of the property on the north, south, and east sides that is in poor condition. The paint has chipped in several locations leaving the iron surface exposed. There is visible oxidation on the exposed surface and possible corrosion. In addition, the fence foundation appears to have been undermined at several locations and several sections of fencing are leaning. A section of fence on the west side has been shored to prevent collapse. The fence prevents pedestrian traffic over the berm; so, RKCI recommends repair or replacement of the leaning sections of fence in the Short Term. To prolong the life of the remaining sections of fence, RKCI recommends stripping the existing coating and repainting the fence in the Short Term. Refer to Photograph 28 through 31.

Dumpster Areas. Dumpster areas are located on the concrete pavement and are in good condition.

Site Lighting. Site lighting is provided by high mast light poles around the property. The light poles were not in operation at the time of our site visit; so, RKCI was unable to assess whether the poles were functional. In general, the poles were in fair condition. Typical distress conditions include surface oxidation and corrosion of the pole bases. Further assessment of the light poles is recommended in the Short Term. Refer to Photograph 32.

Signage. Building mounted signage exists on various facades. The signage appears to be in good condition.

Landscaping. The landscaping around the building and site consists of native grasses, shrubs, and large trees. In general, the landscaping is in good condition.

Landscape Irrigation. N/A

Site Drainage. Visually, site drainage appears to be poor. A large berm surrounds the building which allows surface run-off to drain directly to the building foundation. RKCI observed a trench which is likely a French drain around the perimeter of the building. We suspect the French drain collects runoff and groundwater (if any). Refer to Photographs 32 and 33. Assessment of the French drain was outside the scope of this project.

Wetlands. N/A

Canopy Structure. There is an existing canopy structure in the exterior amphitheater area that is in poor condition. RKCI observed surface oxidation and likely corrosion of the steel structural members. RKCI recommends further assessment of this structure in the Short Term to ensure the structural framing does not have a significant loss of section due to corrosion. Refer to Photographs 33 through 40.
Flagpoles. There are numerous flagpoles located on the west side of the building. The flagpoles are in fair condition. RKCI observed several flagpoles with dents in the pole wall, likely from impact. In addition, several of the pole tops were bent. At the time of our assessment, it does not appear that the poles have been compromised. RKCI recommend monitoring for future deterioration. Refer to Photographs 41 and 42.

Fountain The fountain located on the west side (front) of the building was not operation or accessible at the time of our site visit. RKCI performed observations from the balcony overhead. In general, the fountain structure appeared to be in good condition. Refer to Photographs 336 and 337.

2.05 BUILDING STRUCTURE

General. The subject building is constructed with reinforced concrete and appears to be in good condition. Representative photographs are included in Attachment B.

Foundation/Slab. The building foundation is below grade and not visible. No visible evidence of structural distress was observed relating to the foundation elements. The type of foundation system could not be ascertained and construction drawings specific to the foundation were not available; however, visual observation indicates the slab at the lowest level is a floating slab-on-grade. Building structural elements are likely supported on deep piers or shallow spread footings. The interior concrete floor slab was either exposed concrete or covered with carpet or vinyl composition floor tile. Cracking or signs of distress that might be telegraphed through the floor coverings were not observed. Cracks typical for the age of the building and type of construction were observed in limited locations throughout the slab where there are not floor finishes. RKCI did observe some distress around the expansion joint. It is unclear whether this distress is from differential movement of the foundation or thermal expansion and contraction. Representative photographs are included in Photographs 43 through 45.

Building Framing. Building framing appears to consist of precast or cast-in-place concrete columns and cast-in-place concrete girders. The exterior walls appear to be precast concrete panels. It is unknown whether these walls are load-bearing. No distress was observed in the columns or exterior walls that indicate structural instability. RKCI did observe some spalls in the exterior wall panels with exposed rebar. We recommend cleaning the exposed rebar and patching the concrete in the Short Term to minimize damage to the reinforcing steel. Refer to Photographs 46 through 48.

Roof Framing. Except at the upper roof level over the projection room, the roof framing of the building is a concrete waffle slab as observed through absent ceiling tiles and exposed structure. The roof framing over the projection rooms consists of open-web steel joists, supported on concrete beams. No visible evidence of structural distress was observed in the roof framing. RKCI did observe staining on some of the concrete members that may indicate moisture infiltration. RKCI is unsure of the source of the possible moisture; however, it is possible moisture is penetrating through the roof coverings. At the time of our assessment, RKCI did not observe damage to the roof framing due to the moisture; therefore, no additional action is recommended at this time. Please refer to Photographs 49 and 50 for representative conditions.
Floor Framing. The floor framing of the building is a concrete waffle slab as observed through absent ceiling tiles and exposed structure. No visible evidence of structural distress was observed in the floor framing. RKCI did observe staining on some of the concrete members that may indicate moisture. RKCI is unsure of the source of the possible moisture. At the time of our assessment, RKCI did not observe damage to the floor framing due to the moisture; therefore, no additional action is recommended at this time. Refer to Photographs 51 through 54 for representative conditions.

Pedestrian Bridge There is a suspended pedestrian bridge that extends from the front doors of the Institute to the west parking lot. The concrete bridge deck is supported on reinforced concrete beams. The beams are supported by concrete girders that are, in turn, supported by concrete retaining walls. The bridge railing is comprised of precast concrete posts with a precast concrete top rail and tube-steel vertical members. The bridge deck is covered in granite-slab panels. In general, the pedestrian bridge appears to be in good condition. RKCI observed severe moisture staining on one of the retaining walls where it appears pipes penetrate through the wall. RKCI also observed moisture staining on the sides of the bridge. Several of the precast railing posts had cracks in the pebble finish and some of the granite slabs were cracked. RKCI recommends cleaning the moisture-stained concrete in the Short Term and a visual assessment of the concrete to ensure the concrete is in good condition. In addition, RKCI recommends sounding the railing posts to assess whether the concrete is delaminating. Any deleterious concrete should be removed and the concrete patched to match existing. Refer to Photographs 338 through 341.

2.06 BUILDING EXTERIOR

Wall Assembly/Finish. The exterior wall assembly consists of precast concrete panels with a smooth rubbed sand finish around the entire building perimeter. In general, the exterior walls appear to be in good condition with limited signs of weathering. Refer to Photograph 67.

Glass/Glazing. The aluminum frame storefront windows are present next to the double entry door openings. The glazing appears to be in overall good condition. The window gasketing appears to be in good condition on all facades.

Soffits. Soffited areas above the covered walkways appear to be in good condition.

Sealants. Perimeter sealants have an average life expectancy of 15 to 20 years. Accelerated deterioration will occur which may allow water to infiltrate adjacent to the foundation and into the building interior. RKCI recommends the replacement of these sealants in the Short Term. Refer to Photograph 68-70.

Doors. There are double entry glazed doors along the north, south, east and west facades at the lower level and at the loading dock area. There is an automatic sliding door at the east/front elevation. In general, all doors appear to be in good condition.

Loading Docks. Loading docks occur along the west facade of the building. Loading dock equipment and doors appear to be in good to fair condition.

Roofing. No plans or specifications were available for review or use in this survey. The roof(s) were reported to be the original roofs installed during the original construction of the building. The installing contractor is unknown. No warranty information was provided to RKCI. No interior leaks were noted or reported to RKCI.
The low-slope roof consists of a two-ply modified bitumen membrane with granulated surfacing and aluminum clad base flashings at the roof-top penetrations and at the exterior perimeter/parapet wall. The existing low-slope roof appears to be sloped at the approximate rate of 1/8” per foot to internal primary roof drains. Overflow scuppers present in the perimeter/parapet wall are serving as the emergency overflow system. During our visual assessment, multiple adverse surface conditions were observed including: membrane shrinkage, membrane alligatoring, membrane crazing, interply membrane blisters, ponding water on the membrane surface, open laps at membrane flashings, and damaged membrane flashings. Due to the severity of these adverse roof conditions and the general overall roof condition, each adverse roof surface condition will not be further discussed. Refer to Photographs 55-63.

In light of the problems observed on these roofs and the useful service life of this type of roof system which is typically 20 years, replacement of the roof system is recommended.

A standing seam metal wall panel system was observed in the center of the roof area over the projection room. The metal wall panels and the metal wall panel system appeared to be in overall good condition with isolated locations of surface oxidation. No signs of leaks were observed or reported at this area.

The exterior paint that appears to be installed over the galvanized metal panels is beginning to peel and flake away from the metal panels. It is RKCI's recommendation to remove the existing paint and install new primer and paint over the existing galvanized panels. Due to the recommendation of installing a new roof system in the Short Term, it is RKCI’s recommendation to install the new paint at the metal wall panels at the same time in order to avoid roof-top traffic over a new roof at a later date. Refer to Photographs 64-66.

**Roof Replacement Options**. The configuration of the roof support structure on this building appears to be appropriate for the application of several types of replacement roof systems. When factors such as expected service life, initial cost, serviceability, maintenance requirements, logistics, regional considerations and resistance to physical damage are considered, it is recommended that the replacement roof systems be composed of one of the following generic roof systems (shown in order of preference):

1. Adhered Thermoplastic Single Ply Roof System
2. Hybrid Reflective Coated Modified Bitumen Roof System (Hot or Cold Applied)

A discussion of the benefits and liabilities of each of these systems is given in the following tables:

<table>
<thead>
<tr>
<th>TABLE 1 –ATTACHED THERMOPLASTIC SINGLE PLY ROOF SYSTEM</th>
</tr>
</thead>
<tbody>
<tr>
<td>BENEFITS</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
</tr>
<tr>
<td>Thermoplastics systems are tolerant of less than ideal weather conditions at the time of installation (heat welded seams)</td>
</tr>
<tr>
<td>Seams, wall flashing joints and flashing is heat welded to create a monolithic system</td>
</tr>
<tr>
<td>Thermoplastic materials are tolerant of minor building and deck movement</td>
</tr>
<tr>
<td>Will tolerate moderate ponding water conditions</td>
</tr>
<tr>
<td>Low to medium life cycle cost</td>
</tr>
</tbody>
</table>

</tbody>
</table>

Infrared Roof Moisture Survey. N/A

Roof Warranty. No roof system warranties were provided to RKCI for review. Considering the age of the building, RKCI believes that a warranty by the installing contractor is no longer valid.

2.07 BUILDING INTERIORS

General. In general, the interior finishes are in good condition. Distress conditions observed are typical for the building of this age and type of use. Refer to Photograph 71.

Flooring. Flooring varied from typical carpet and vinyl composition tile to exposed concrete. Ceramic tile was present in restrooms. Most flooring appeared to be in good condition. RKCI observed isolated areas where the floor covering were damaged or stained. This type of distress is typical for buildings of this age and usage. The ceramic tile in the third floor restrooms was in fair condition. The tile is stained and is showing signs of wear and tear; however, the tile appears to be in serviceable condition. If the Client elects to replace the aged and stained flooring, RKCI recommends replacement in Year 2 of the Long Term. Please refer to Photographs 72 through 75. Although the remaining flooring is considered to be in good condition, the flooring style is outdated. RKCI has provided optional costs for replacement.
Walls. Wall finishes varied from painted gypsum board to exposed concrete or masonry. All wall finishes appeared to be in fair to good condition. Most distress conditions observed are typical for a structure of this age and building use. Typical distress conditions include staining and damage from impact. RKCI also observed cracks at isolated locations. Refer to Photographs 76 through 78. Although the wall coverings are considered to be in good condition, the style is outdated. RKCI has provided optional costs for renovations.

Ceilings. Most ceiling were exposed structure, some painted. Ceilings in office spaces and corridors were typically lay-in acoustical tile. All ceiling finishes appeared to be in fair to good condition. Common distress conditions include staining from HVAC condensate, cracked or broken tiles, missing tiles, and tiles that are uneven. This type of distress is common for buildings of this age and use. Refer to Photographs 79 through 81.

Interior Doors. Doors ranged from solid core metal to hollow core veneer in wood and metal frames. All doors appeared to be in fair condition. Typical distress conditions include staining or damage from impact. This type of distress is common for buildings of this age and use. Although the interior doors are considered to be in good condition, there are signs of distress and age. RKCI has provided optional costs for replacement.

Windows. Window frames and glazing appeared to be in good condition.

Interior stairs. In general, interior stairs appeared to be in good condition. RKCI did observe one set of stairs in Room 1.06.03 that was in poor condition. At the base of the stairs, a portion of the concrete has spalled and there is exposed rebar. The rebar is corroded with a significant loss of section. RKCI recommends these stairs be assessed by a structural engineer and a suitable repair developed to prolong the useful life of the stairs. Refer to Photograph 82.

Building Amenities. N/A

2.08 MECHANICAL SYSTEMS

General. An assessment of the Mechanical systems at the UTSA Institute of Texan Cultures was conducted by Cleary Zimmermann Engineers. This assessment is intended to study the existing conditions of the mechanical systems. The assessment findings are based on existing as-builts, visual assessments of equipment, and acquired information during Cleary Zimmermann’s site visit.

To understand the buildings’ mechanical systems and conditions at the time of the site visit, Cleary Zimmermann has prepared this section of the report.

Central Plant. The central plant is located near the northeast corner of the building next to the loading dock. The central plant houses two chillers and six pumps that serve the hot and chilled water loops. Located outside of the pump room is an evaporative cooling tower that serves the two water cooled chillers, and two hot water boilers that serve the hot water loop. These chillers and boilers supply the hot water and chilled water utilized by the Air Handling Units (AHUs) throughout the building.
Chillers. There are two identical 225-ton York Rotary Screw Liquid Chillers. Both chillers use R-22 refrigerant and appeared to be in good condition at the time that visual assessment was performed. Unit tags indicate that both units were built in the year 1998 (Photograph 88). The insulation on the evaporator of both units showed signs of degradation (Photograph 84). The oil separator on Chiller 2 (Unit Tag: CHLR-ITC-002) showed signs of minor physical damage to the exterior of the unit. Both unit control panels appeared to be in good condition.

The central plant housed the two chillers and pumps serving the hot water and chilled water loops. It is recommended that the insulation be replaced on the chillers. The chiller’s refrigerant is R-22 and obsolete if replacement parts are needed in the future replacement. It is recommended that the chillers be replaced in Year 4 of the Long Term.

Pumps. There are two condenser water pumps, two chilled water pumps, and two hot water pumps serving the hydronic piping system. At the time of visual inspection all pumps appeared to be in good condition. It appears that deteriorating piping insulation to the hot water pumps was repaired using duct tape (Photograph 94). Condenser Pump 2 is showing wear and deterioration due to years of service life (Photograph 91). A job tag on Condenser Water Pump 1 (Photograph 100) appears to be dated 8/9/16.

The pumps showed wear due to service life year but were operational and in good condition; however, it is recommended that the pumps be replaced when boilers/chillers are replaced in Year 4 of the Long Term.

Boilers. There are two boilers outside of the central plant that serve the hot water loop. Both units appeared to be in good condition at the time of the visual inspection. Both units are open to the environment and showed signs of corrosion on the exterior of the units (Photographs 102 & 103). Tarps were hung on Boiler 1 to protect the unit from a leak on the adjacent cooling tower unit (Photograph 102).

Cooling Tower. The cooling tower is a 538-ton Evapco Two Cell Cooling Tower (Photograph 106). The cooling tower was in good condition at the time that the visual inspection was performed. The exterior of the unit showed signs of corrosion and wear from exposure to the elements (Photograph 107). The body of the hand valve on the makeup water line was cracked or damaged and was actively leaking, spraying the cooling tower and wetting the surrounding boilers and equipment (Photograph 108). The cooling tower has significant wear and leaks, with significant build up on the condenser fins. It is recommended that the condenser be repaired and maintenance/cleaned in the near future. The cooling tower is approaching the end of its useful life; therefore, we are recommending budgeting for replacement in Year 5.

Air Handlers. The building is currently served by 15 Air Handing Units (AHUs): 3 located on the basement floor serving the 1st floor, and 12 units located on the 3rd floor serving both the 2nd and 3rd floor. The AHUs in this facility are all multizone units, being ducted to multiple rooms, areas or zones of the building. Each AHU is controlled with a DDC (Direct Digital Control) system by converting electronic input signals to electronic and pneumatic outputs, controlling pneumatically actuated air dampers and electronically actuated hydronic valves. It was observed that most hydronic piping branches to each AHU had visible signs of deterioration with missing or deteriorated insulation. All units were operating and in fair condition at the time of the site visit.

- **AHU 10** - AHU 10 (Photograph 110) is located on the First “Basement” Level in Room 1.02.08C. This is a multi-zone unit that serves 7 different zones (Photograph 111). There is corrosion on the hydronic piping (Photograph 113) and degradation of the insulation on some of the piping to the unit (Photographs 114 & 115). This unit is dated and past its useful service life.

- **AHU 11** - AHU 11 (Photograph 116) is located on the First “Basement” Level in Room 1.02.08C. This is a multi-zone unit that serves four different zones (Photograph 117). This unit has corrosion on
some of the piping to the unit and has incomplete insulation from previous repairs (Photograph 119). This unit is dated and past its useful service life.

- **AHU 17** - AHU 17 (Photograph 120) is located on the First “Basement” Level in Room 1.06.03A. This is a multi-zone unit. This unit has signs of corrosion on several lines to the unit, as well as damaged insulation around a strainer on the chilled water line (Photographs 123 & 124). It was noticed that the strainer was corroded, making it difficult to perform maintenance. This unit is dated and past its useful service life.

- **AHU 6** - AHU 6 (Photograph 125) is located on the third level in Room 3.12.11. This is a multi-zone unit serving five zones (Photograph 126). This unit is dated and past its useful service life.

- **AHU 9B** - AHU 9B (Photograph 128) is located on the third level in Room 3.12.11. This is a multi-zone unit serving five zones (Photograph 129). The hydronic piping branches to the unit appeared to be in good working conditions. This unit is dated and past its useful service life.

- **AHU 12** - AHU 12 (Photograph 130) is a multizone unit, located on the third level in Room 3.12.11. This unit is dated and past its useful service life.

- **AHU 4** - AHU 4 (Photograph 132) is located on the third level in Room 3.04.09. This is a multi-zone unit serving six zones (Photograph 133). This unit is dated and past its useful service life.

- **AHU 5** - AHU 5 (Photograph 136) is located on the third level in Room 3.04.09. This is a multi-zone unit serving five zones (Photograph 137). The piping and insulation for this unit was visually in good condition (Photograph 138). This unit is dated and past its useful service life.

- **AHU 9A** - AHU 9A (Photograph 141) is located on the third level in Room 3.04.09. This is a multi-zone unit serving five zones (Photograph 143). This unit is dated and past its useful service life.

- **AHU 14** - AHU 14 (Photograph 144) is a multi-zone unit located on the third level in Room 3.12.11. This unit is dated and past its useful service life.

- **AHU 7** - AHU 7 (Photograph 146) is located on the third level in Room 3.04.17. This is a multi-zone unit serving seven zones (Photograph 147). The hydronic piping and insulation for this unit was visually in good condition. Some foam pipe insulation is exposed and has not been insulated over (Photograph 148). This unit is dated and past its useful service life.

- **AHU 15** - AHU 15 (Photograph 150) is located on the third level in Room 3.04.17. The hydronic piping and insulation for this unit was visually in good condition. Some foam pipe insulation is exposed and has not been insulated over (Photograph 155). This unit is dated and past its useful service life.

- **AHU 8** - AHU 8 (Photograph 156) is located on the third level in Room 3.07.01A. This is a multi-zone unit serving seven zones (Photograph 157). The hydronic piping and insulation for this unit was visually in good condition. Some foam pipe insulation is exposed and has not been insulated over (Photograph 160). Some of the condensate lines are piped loosely to a floor drain (Photograph 161) which is not sloped properly. This unit is dated and past its useful service life.

- **AHU 13** - AHU 13 (Photograph 162) is located on the third level in Room 3.07.01A. This is a multi-zone unit serving four zones (Photograph 163). This unit is dated and past its useful service life.

- **AHU 3** - AHU 3 is a multi-zone unit located on the third level in Room 3.12.11. This unit is dated and past its useful service life.

All Air Handling Units are multizone style AHUs and are dated and beyond their useful service life. It is recommended that the units be replaced with Single-Zone Variable Air Volume Units with terminal units for better zone control in the Short Term. In addition, as units are replaced it is recommended that unit controls are converted to full DDC. In lieu of replacement, a short-term action and a more immediate recommendation, is to perform functional testing on all units and ensure that dampers and other instruments on the units are fully functional and have not seized.
**Roof**  The roof consisted of exhaust fans, outside air intake roof hoods, and two condensing units. The roof is accessible through a staircase that leads up to a roof hatch (Photographs 166 and 167).

**Outside Air Intakes**  There are 17 outside air intake roof hoods located on the roof of the facility (Photograph 170). Many roof hoods showed signs of particulate buildup on the underside of the air intake on the inlet grills (Photograph 169). The roof hoods were found to be in fair condition with some normal wear to due service life years.

**Exhaust Fans**  There were 14 exhaust fans (EFs) on the roof with varying conditions. Approximately half of the EFs were operational (Photograph 171). Several operational fans were audibly louder than a typical roof mounted fan and possibly facing mechanical issues due to age and exposure to the elements. Some of the operational fans were missing hardware securing the top cap to the fan (Photograph 176). Several fans had the top cap hood removed (Photograph 173) exposing the motor and other internal components such as wiring (Photograph 174) and were not operational.

It is unclear what the building’s exhaust and outside air flow rates are currently. It is recommended that a full analysis be performed to determine building pressurization. It is also recommended that roof mounted exhaust fans be replaced to ensure proper exhaust airflow rates are met.

**Condensing Units**  There are two condensing units located on the roof. Condensing Unit 1—labeled CU-1 (Photograph 177)—is an EMI Ductless Split System Condensing Unit with Model Number SCC 30DF. It has 28400 BTUH of cooling capacity and 26200 BTH heating capacity. The unit did not appear to be operational at the time of visual inspection—power to the unit was switched off (Photograph 179). The fins on the unit showed moderate damage (Photograph 178). The second condensing unit (Photograph 180) appeared to be a Copeland condensing unit. This unit was not operational at the time of visual inspection and appeared to be decommissioned. The unit showed significant corrosion and wear from exposure the elements (Photograph 181).

**Woodshop**  The woodshop consists of a Donaldson Unimaster dust collector unit (Photograph 182) with associated ductwork distribution and multiple drops located throughout the woodshop (Photographs 185, 186 & 187). This unit was not operational during the time of visual assessment; but, visually appeared to be in good condition. Many of the workstation dust control drops were not completely ducted to the workstations or had damage to the workstation duct drop (Photograph 188).

**General**  The main chilled and hot water piping appeared to be in fair conditions; however, in some areas throughout the building, it was noticed that piping was exposed due to deteriorated or missing insulation. It was noted that some sections of piping throughout the building were repaired or replaced. The building’s control system is a combination of Direct Digital Controls and pneumatic controls by Siemens as shown in the AHU section. Ductwork showed some deterioration in some areas with visible patching and repair work throughout. Condensate piping in mechanical rooms was missing insulation or had deteriorated insulation. AHU-H-1 is a dehumidification unit associated to the Copeland condensing unit on the roof, this unit served room 3.04.14 C, and appeared to not be operable at the time of the site visit. The unit’s use is to maintain certain temperature and humidity requirements for that room, and it included a control panel to monitor and modify temperatures and humidity levels. All thermostats throughout the building are dated, and in most cases included pneumatic tubing.

**Additional Recommendations**

It is recommended any piping with missing insulation be properly re-insulated to avoid heat loss/gain through the pipe.
It is to be noted that it appeared that there is no smoke separation between level two and level three of the building. Based in what was observed, air is returned through the dome theater and back to level three.

The dehumidification unit serving 3.04.14C is to be replaced in the near future if the room will continue to be used and requires certain temperature and humidity levels.

Due to the age of the Mechanical Systems and the results of the Accreditation Facility Assessment Report, provided to RKCI by the Client and dated June 17, 2021, RKCI has provided optional costs for complete removal, re-design, and replacement of the HVAC system.

2.09 ELECTRICAL SYSTEMS

General An assessment of the electrical systems on all three floors at the Institute of Texans Cultures was conducted by Cleary Zimmermann Engineers. This assessment is intended to assess the existing conditions of the electrical systems. The assessment findings are based on existing as-builts, visual assessments of accessible equipment, and acquired information during Cleary Zimmermann’s site visit.

To understand the buildings’ electrical systems and conditions at the time of the site visit, Cleary Zimmermann has prepared this section of the report.

Service Entrance The building is serviced from a vault transformer (underground) located in the service yard, which steps the primary utility down to a 277/480V, 3 phase, 4 wire, wye distribution system. The 480V, 3 phase secondary utility is then carried into the building via bus duct, from the vault to the main electrical room. The existing electrical drawings indicate use of asbestos fire barriers around metal bus duct as it transitions into the building. Refer to Photograph 189.

Distribution Equipment The Main Switchboard is located in the main electrical room of the lower level. It is rated 277/480V, 3 phase, 4 wire, 4000A, and utilizes the “6 handle rule”, which allows up to 6 disconnecting means without the use of a main disconnecting means ahead of the distribution. The main distribution board also utilizes draw-out style switches with fuses. The main board sections off for distribution, via split-bus, to a lower rated distribution section, rated for 2000A. The equipment is General Electric brand, and appears in good condition, however it is likely exceeding its useful life. While there is some expansion space available, the main board is unlikely to accommodate significant alterations and additions due to physical bus space limitations. The electrical service is solidly grounded at the Main Switchboard. Refer to Photograph 190.

The building also utilizes an emergency generator to support the fire pump, life safety, and basic stand-by needs via automatic transfer switch and emergency panel distribution. The generator is Generac, approximately 250-300 KVA with sub-base diesel fuel tank. The generator appears to be newer than the original design (within the last 25 years) and is in good condition. Maintenance reports were not obtained for further study of any repairs or trouble issues. Refer to Photograph 191.

The larger mechanical equipment throughout the building is currently served out of a series of motor control centers of many different makes/models. Many of these motor control centers are aging and are likely past their useful life. With modern technology and controls of the newest mechanical equipment, motor control centers are being phased out in traditional distribution yet may still be used in specialized industrial environments. With any upgrades to the current mechanical equipment, it is expected that these motor control centers will be retired from use. Refer to Photographs 192 and 193.
The general electrical distribution is supported through standard electrical panels ranging from 100A to 600A ratings. Dry-type transformers set on housekeeping pads are commonly used throughout the building to step the voltage from 480/277V to 120/208Y. The panels and transformers appear to vary in age, with some that are original to the building, and others that have been added or replaced through various interior renovations. The older equipment contains some minor code violations, such as missing blank covers (refer to Photographs 194 and 195). While some of the newer equipment may be reused (if aged within the last ten years), it is recommended that all panels be replaced when the area it serves is updated or renovated, in order to comply with current codes and to allow for ease of finding replacement parts. It should be noted that the shock hazard and arc flash labels are missing in many locations; however, generic warning labels were seen in some locations.

The current available as-built s do not include a complete one-line diagram, however, a partial one-line diagram is included in Attachment G for reference.

**Rooftop Equipment**  Based on visual observation, there is minimal rooftop electrical equipment. The equipment appears to be in decent condition; however general weathering is visible and may warrant replacement of equipment in the near future. One of the pieces of mechanical equipment does not have a service receptacle located within 25 ft of the equipment, as required by Section 210.63 of the NEC. Refer to Photographs 196 and 197.

**Site Electrical**  Throughout the site, there are small electrical distributions set up for use during the annual Folklife Festival. Participants, vendors, and food booths utilize these distribution locations to power their equipment during the festival. These mini-distribution centers are showing weathering typical of their 15+ year age, however they are in working condition. It is expected that replacement of this equipment will be necessary within the next 10 years. It should also be noted that this distribution is located throughout the campus and caution is necessary when digging. Refer to Photograph 198.

**Lighting System**  The lighting systems in the building varied among the different spaces but were generally a combination of older fluorescent technology and incandescent lighting. In a few areas, lamping has been replaced with LED technology. The color temperature varies from a warm yellow (2000K) up to a cool blue (4000K). It is recommended that all lighting systems be replaced with the newest LED technology, to both reduce the energy consumption, and improve the visual aesthetic of the space.

Lighting controls are generally manual throughout the building, utilizing basic toggle switches in general spaces. The use of specialized lighting control panels for the museum and exhibit areas were observed, however, these controls are in need of updating as well. If the Client plans for major renovations, lighting controls throughout the building will need to be brought up to current IECC requirements to achieve energy conservation standards. The use of automatic control devices should be used in all locations, with the exception of exhibit and museum space.

First Floor Lighting - Refer to photos 199 and 200
Auditorium Lighting – Refer to photo 201
Artifact Room Lighting – Refer to photo 202
Restroom Lighting – Refer to photos 203 and 204
Break Room Lighting – Refer to photo 205
File Room Lighting – Refer to photo 206
Hallway Lighting – Refer to photos 207 and 208
Painting Storage Lighting – Refer to photo 209
Welding and Shop Lighting – Refer to photo 210
Conclusion In general, the electrical systems within the building are operational, however, they are approaching or exceeding their useful life. If the building is intended for renovation and reuse, it is recommended that the electrical systems be rebuilt with latest technology and in compliance with current codes.

2.10 PLUMBING SYSTEMS

General The building consists of three floors with restrooms on the first and third floors. Elevators and stairwells are located on each of the four corners of the building. Domestic cold water, hot water, and natural gas are routed throughout the first and third floors.

To understand the buildings’ plumbing systems and conditions at the time of the site visit, Cleary Zimmermann has prepared this section of the report.

Sanitary Sewer. The sanitary sewer piping that was visible above ground consists of cast iron pipe that appears to have been painted recently. Small sections of piping that haven’t been painted were seen and are assumed to be a representation of the piping throughout the building. The cast iron piping appears to be in fair condition given its life. The sanitary piping above ceiling or below floor was not visible during the time of assessment. Evidence of possible leakage was seen in a section of unpainted pipe, further inspection and repairs as needed are recommended. Refer to Photographs 244, 248 and 249.

The sump pit was not accessible during the assessment however the piping above the pit was observed and appears to have been painted. Refer to Photographs 233 through 254 for typical sanitary piping and sump pump room. It is recommended that the cast iron piping throughout the building be scoped by a plumbing camera to verify pipe condition. The floor drains in the mechanical room and central plant were observed and appear to be in poor condition.

It is recommended that floor drains be replaced and sanitary piping be scoped in the Short Term to verify condition. Refer to Photographs 262 through 267.

Storm Drainage. Roof drainage is directed to roof scuppers that extend to 6” drain piping below roof and connect to 8” mains. The drain piping is routed to the risers behind the elevators. The roof drain risers transition to 12” cast iron piping on the first floor. Eighteen of the roof drains on the east side of the building are routed out of the building on the first floor. The remaining ten roof drains are routed to the sump pit on the southern end of the first floor. The roof drains and drain piping appeared to be in good condition. The sump pit was not accessible during the assessment however the piping above the pit was observed and appears to have been painted. Refer to Photographs 268 through 280 for typical roof drain scuppers and piping.

Domestic Cold and Hot Water Supply. The domestic cold water supply was observed in the first floor mechanical room. The piping looks to be in fair condition. Small sections of piping appear to have been repaired or modified in the past. No leaks were observed during the assessment. It is recommended that the pipe insulation be tested for asbestos before any work is performed on piping.

The domestic hot water supply was observed in the first floor mechanical room. The piping looks to be in fair condition. Small sections of piping appear to have been repaired or modified in the past. No leaks were observed during the assessment. It is recommended that the pipe insulation be tested for asbestos before any work is performed on piping. Some sections of piping had missing or damaged insulation and it is recommended that insulation be applied or repaired on those sections. Refer to Photographs 285 through 288.
A 119-gallon electric water heater exists in the first floor mechanical room and serves as the main water heater for the building. The water heater was manufactured in 2012 and appears to be in good condition. A second smaller water heater exists in the mechanical room and appears to deliver hot water to a mop station. The water heater is in good condition. Two 40-gallon water heaters exist in room 1.04.07 and appear to be past their service life. It appears that the water heaters deliver hot water to rooms 1.04.07 and 1.04.03. It is recommended that the water heaters be replaced in the Short Term if the fixtures are to be in use. There is no floor drain near the 40-gallon water heaters, so a floor drain will need to be added to keep the water heaters in service. All water heaters will need to be sitting in a drain pan on a housekeeping pad with a PVC drain routed to a floor drain or floor sink. A vacuum breaker, heat trap, and expansion tank will need to be added to the cold water (CW) line entering the water heaters. Refer to Photographs 294 through 295 and 302 through 305 for water heaters. Refer to Photographs 281 through 305 for all domestic piping and water heaters.

**Natural Gas.** Natural gas piping was observed at the central plant to serve the boilers. The piping appeared to be in good condition. Refer to Photographs 307 through 314 for natural gas piping.

**Pump Room.** The pump room contains four pumps meant to deliver water to the fountain outside of the building. The pumps are currently not operational, and the piping has been cut and abandoned. The piping would need to be welded back together and new pumps may be required for the fountain to be operational. A large storage tank and pump also exists in the pump room as part of the fountain system. The pump next to the storage tank may need to be replaced as well. Refer to Photographs 324 through 335 for pump room photos.

**Plumbing Fixtures.** The restrooms consist of white vitreous china water closets, urinals, and lavatories. The water closets and urinals are wall hung fixtures with manual flush valves. The third-floor restrooms consist of wall hung lavatories with manual faucets. The public first floor restrooms consist of countertop lavatories with automatic faucets. The restrooms near the sump pump rooms consist of undermount lavatories with manual faucets. All fixtures appear to be in good condition. Refer to Photographs 219 through 232 for all fixtures. Drinking fountains of various types and ages exist throughout the building primarily next to restrooms. Drinking fountains may need to be changed to meet ADA requirements. Refer to Photographs 229 through 232 for drinking fountains.

### 2.11 FIRE/LIFE SAFETY PROTECTION

**General** The existing system appears to be generally in good condition and is up-to-date with current inspections. However, according to the building manager, there are code violations, especially with fire separation between rooms. An in-depth assessment of the fire protection systems is beyond the scope of this project; however, the Client may elect to perform an in-depth assessment of the fire protection systems.

**Sprinklers.** A sprinkler system was observed.

**Fire Pump.** The fire pump exists in room 1.02.04. It appears to be in good condition. The pump is accompanied with a fire pump controller that appears to be in good condition. Refer to photos 315 through 335 for fire pump.

**Fire Hose Racks.** N/A

**Fire Hydrants.** N/A
Lighting. Emergency egress lighting appears to be supported by a combination of both emergency generator circuits and integral battery. However, it is not consistent throughout the building. Egress lighting is currently served by “bug eye” emergency lighting in the corridors and common spaces. In portions of the building that still incorporate original lighting, there may be egress lighting supported by the generator only. However, in more recently renovated areas, fixtures include integral batteries for life safety operation. Overall, the emergency lighting seems to be inadequate throughout the building, and it is recommended that the emergency egress lighting be supported through the same consistent source.

Options include building a life safety branch on the generator, utilizing inverter systems (large batteries that serve many light fixtures), or integral batteries within individual light fixtures. Additional emergency lighting will likely need to be added to meet the IBC and NFPA 101 requirement for 1 fc minimum in exit corridors. There was no “egress discharge” emergency lighting, required by the IBC, observed at the discharge locations of the space. Emergency egress discharge lighting will need to be provided to illuminate the exit discharges and 10 feet beyond at 1 fc.

Fire Alarm. The building currently utilizes a Simplex 4100U fire alarm system. This existing system is an analog addressable system, however, the system is obsolete and no longer in production. The system has very limited functionality and it is recommended that with any major renovation to the building, a new fire alarm system should be installed, incorporating networking capabilities and easy touch-screen applications. The requirements of detection, notification, and monitoring of peripheral systems (HVAC, fire sprinkler, etc.) is required by code. Refer to photo 241.

Smoke Detectors. Smoke detectors were observed.

Portable Fire Extinguishers. Portable fire extinguishers were observed.

Smoke Separation. Smoke separation was not provided between the second and third floors. Also, smoke separation was not provided between the dome room and adjacent office spaces.

Rooftop Fall Protection Systems. Fall protection systems were observed along the perimeter of the roof and included metal wire run through eye-hooks bolted to the structural framing. In general, the wires were in poor condition, with significant corrosion and failure in some locations. Near the northeast corner of the roof, a secondary fall protection system comprised of ballasted tie-off points was observed which appeared to be in good condition. A detailed analysis of the fall protection systems should be performed with the expectation of replacing the entire perimeter tie-off system. In the meantime, a roof monitor fall protection system should be implemented for work on the roof.

Guardrails. Interior guardrails around the primary staircase between the first and second floors were measured to be 32 inches tall, which is less than current code requirements.

2.12 ADA COMPLIANCE

ADA surveys. RKCI did not review or observe a Notice of Substantial Compliance from the Texas Department of Licensing and Regulation indicating that the buildings were in substantial compliance with the Texas Architectural Barriers Act, Article 9102, Texas Civil Statutes. No previous or current complaints related to accessibility were reported.
Parking. Accessible spaces provided do not satisfy current code authority requirements. Per current code, the property is required to have five (5) accessible spaces and two (2) van accessible spaces for a total of seven (7) accessible spaces. RKCI observed five (5) accessible spaces and one (1) van accessible space for a total of six (6) spaces. Per current code one (1) additional van accessible space is required. RKCI recommends adding one (1) van accessible space in the Short Term to meet current code requirements.

Curb Ramps. Curb ramps located on the north and south sides of the building appear to generally meet ADA guidelines for width and slope.

Walkways. Walkways appear to generally meet ADA guidelines for width, slope, headroom, and barriers.

Entry Doors. The interior doors in the accessible route have ADA compliant hardware and appear to meet ADA guidelines for door width and depth.

Restrooms. The facility has six (6) restrooms (three women’s and three men’s restroom) with handicap accessible signage on the door; however, only four (4) of these restrooms meet accessibility guidelines. Rooms 3.03.02 (men’s) and 3.02.03 (women’s) are labeled as accessible restrooms; however, they do not meet the following accessible specifications:

- The public toilet rooms are not wide enough to accommodate a wheelchair turnaround (60 inches);
- Toilet stall doors are not wheelchair accessible (32-inches wide);
- Grab bars are not provided in the toilet stall; and,
- Exposed pipes are not sufficiently insulated against contact.

All other restrooms meet accessibility standards. RKCI recommends removing the accessible signage from Restrooms 3.03.02 and 3.02.03 in the Short Term and replacing the signage that indicates these rooms are not ADA accessible restrooms.

Drinking Fountains/Water Coolers. Some drinking fountains appear to be in general conformance with ADA guidelines.

Public telephones. Accessible public telephones are not installed on the exterior of the building.

Stairs. Stairs appear to be in general conformance with ADA guidelines.

Alarm Systems. Audible/visual (strobe) signaling devices are provided throughout the building and appear to meet ADA guidelines.

Elevators. Elevators appear to be in general conformance with ADA guidelines.

Property Management Interview. N/A
3.0 GENERAL INFORMATION

3.01 PURPOSE AND SCOPE OF SERVICES

General. The purpose of this Property Condition Assessment was to observe and document readily visible building systems and materials to determine if conditions exist that might significantly affect the value of the property and, which may have a significant impact on the continued operation of the facility during the evaluation period. It has been performed using that degree of skill and care normally exercised by reputable consultants performing similar work.

Observation. This assessment included a site visit. Construction documents (drawings and specifications) were unavailable for review. Visual observations are completed for the following system components: site development; building structure; building exterior areas, interior areas; mechanical, electrical, plumbing systems, fire/life safety, and general ADA compliance.

The observations are performed without removing or damaging components of the existing building systems. Consequently, comprehensive studies to identify, document, and evaluate every existing defect or deficiency was not conducted. In some cases, additional studies may be warranted to fully evaluate concerns noted. In addition, system checks or testing of the equipment’s operating condition is beyond the scope of this assessment.

Report. This report is intended to provide a general overview of the building systems and their general conditions. The recommendations and opinions of cost provided herein are for observed deficiencies based on the understanding that the facility will continue operating in its present occupancy classification. Certain assumptions have been made regarding conditions and operating performance. If any additional information is encountered concerning the facility, it should be forwarded to RKCI for possible re-evaluation of the assumptions, conclusions and recommendations presented herein.

The opinions and recommendations presented are based on our observations, evaluation of the information provided, and interviews with personnel familiar with the property. No calculations have been performed to determine the adequacy of the facility's original design. It is possible that defects and/or deficiencies exist that are not readily accessible or visible. In addition, other problems may develop with time that are not evident at the time of this assessment.

The opinions and recommendations in this report should not be construed in any way to constitute a warranty or guarantee regarding the current or future performance of any system identified.

Reliance on this report in any way by parties other than the Client is subject to the contractual terms and conditions in effect between the Client and RKCI for this project. The observations, findings, and conclusions within this report are based on our professional judgment and information obtained during the course of this assessment.

ADA Qualifications. The scope of this report regarding the Americans with Disabilities Act (ADA) is limited to a general overview of the subject improvements common public areas (of improvements considered to be “Public Accommodations”) based upon the requirements of Title III of the Americans with Disability Act (ADA). Per Title III, disabled persons are to be provided accommodations and access equal to, or similar to, that available to the general public. The ADA requires that architectural and communication barriers in ‘public accommodation’ improvements, completed on or before January 26, 1992, be removed if they are ‘readily achievable’ and are not an “undue burden”. Most states and local municipalities have adopted accessibility requirements that, in some cases, may be more stringent than...
the ADA. The review of the subject property for compliance with state and local accessibility requirements is beyond the scope of this report.

The purpose of the ADA section is to identify certain obvious items that do not appear to be in general conformance with the Title III requirements; without inferring that correction of the reported items will bring the property into total compliance with the ADA. While opinions of cost to correct or remove noted barriers are provided herein, they do not constitute an opinion that elimination of the barriers is “readily achievable” and not an “undue burden” as defined by the ADA. The owner must determine this issue. The ADA is not intended to affect the contractual responsibilities existing in lease agreements between owners and tenants. Typically, the tenant is responsible for reviewing and making readily achievable accommodations in their own lease/work space while the owner is responsible for the common areas of the improvements.

If one has not been completed, it is recommended that the property owner obtain a complete ADA audit of the property and that a program plan be established for correcting architectural and communication barriers.

### 3.02 EVALUATION DEFINITIONS

**Good:** Average to above-average condition for the building system or material assessed, with consideration of its age, design, and geographical location. Generally, other than normal maintenance, no work is recommended or required.

**Fair:** Average condition for the building system evaluated. Some work is required or recommended, primarily due to the normal aging and wear of the building system, to return the system to a good condition.

**Poor:** Below average condition for the building system evaluated. Significant work or replacement anticipated to return the building system or material to an acceptable condition.

Unless stated otherwise in this report, the systems reviewed are considered to be in good condition and their performance appears to be satisfactory.

### 3.03 REPORT TENSE

This report has been prepared in the present tense as it is intended to only describe conditions at the time of the site observations.

### 3.04 OPINION OF COST

The opinions of costs presented are for the readily visible materials and building system defects that might significantly affect the value of the property during the evaluation period. These opinions are based on approximate quantities and values. They do not constitute a warranty that all items, which require repair or replacement, are included. Repair item values, either in aggregate or singularly, that are less than $1,000 have not been included in the ‘Capital Expenditure Analysis / Reserve Replacement Schedule’ table, unless life safety is a concern. Narrative portions of the report and/or photographs may depict a certain number of these items for qualification of the conditions of the property.

The opinions presented are based on published unit price data and experience. These opinions should not be interpreted as a bid or offer to perform the work. All costs are stated in present value.
In evaluating the costs presented, it is important to understand that actual costs depend on such factors as design documentation, contractor expertise, existing contractor commitments, seasonal work load, insurance and bonding. These factors may cause wide variations in the actual cost provided from bidder to bidder. In view of these limitations, the costs presented in this report should be considered “order of magnitude” and used for budgeting purposes only. Preparation of detailed design documentation and obtaining competitive contractor bidding is necessary to determine actual costs.

ENVIRONMENTAL SITE ASSESSMENT

RKCI completed the Environmental Site Assessment (ESA) on October 31, 2022. The ESA was conducted in accordance with ASTM E 1527-13. The ESA attempted to identify any recognized environmental conditions that may affect land development; and, includes the review of required regulatory databases, review of available historical information, interviews with property owners, and a pedestrian site reconnaissance. Based on this information, RKCI prepared a written report which includes:

- Documentation of information sources;
- The facts and description of environmental conditions relevant to the site;
- The opinion of the environmental professional of the impact of recognized environmental conditions in connection with the property; and,
- Recommendations for further action.

For the complete ESA report, refer to Attachment C.

ARCHAEOLOGICAL BACKGROUND REVIEW

RKCI conducted and archaeological background review for the Institute of Texan Cultures. The review examined a variety of historical and archaeological resources including, but not limited to, historic-age aerial photography, historical plat and road maps, newspapers, the THC’s Texas Archeological Sites Atlas, city and county archives, and genealogical records. The purpose of the review was to determine land use and development of the project area over time, and to determine the likelihood of encountering significant cultural deposits within the project boundaries that have the potential to be listed on the National Register of Historic Places (NRHP) or be formally designated as State Antiquities Landmarks (SALs).

RKCI has provided a report with the results of the archaeological background review which summarizes the resources consulted, the findings of the review, and recommendations regarding any additional field investigations that may be warranted prior to the inception of the development activities.

For the complete Archaeological Background Review Report, refer to Attachment D.

ATTACHMENT B
PHOTOGRAPHS
PHOTOGRAPH 1 – General view of the west elevation (front of the building).

PHOTOGRAPH 2 – View of parking lot on the west side of the building. Asphalt paving is in fair condition. Concrete paving at the accessible parking spaces is in good condition.

PHOTOGRAPH 3 – General view of parking lot on the east side of the property. Pavement is in fair condition with evidence of full-depth patch repairs, transverse and longitudinal cracking, raveling, and rutting.

PHOTOGRAPH 4 - General view of parking lot on the east side of the property. Pavement is in fair condition with evidence of full-depth patch repairs, transverse and longitudinal cracking, raveling, and rutting.

PHOTOGRAPH 5 – General view of parking lot on the east side of the property. Pavement is in fair condition with evidence of full-depth patch repairs, transverse and longitudinal cracking, raveling, and rutting.

PHOTOGRAPH 6 – View of concrete paving at the service drive/ loading dock area. Concrete pavement is in fair to good condition.
PHOTOGRAPH 7 – General view of the entrance to the service drive on the south side of the property. Concrete pavement is in fair condition with corner cracks and transverse cracks.

PHOTOGRAPH 8 - View of the service drive with transverse and longitudinal cracks.

PHOTOGRAPH 9 – View of the service drive with transverse and longitudinal cracks. Joint sealant is in poor condition.

PHOTOGRAPH 10 – View of concrete sidewalk on the west side of the property. The sidewalk has evidence of differential movement and is considered a trip hazard. Trip hazards are a life safety issue.

PHOTOGRAPH 11 – View of concrete sidewalk with a transverse crack the width of the sidewalk. There is spalled concrete between the crack and the joint.

PHOTOGRAPH 12 – General view of the concrete sidewalk. There is exposed aggregate. Joint sealant is not present.
PHOTOGRAPH 13 – General view of the concrete sidewalk with exposed aggregate and aggregate pops.

PHOTOGRAPH 14 – General view of the patio area on the south side of the building. There is not joint sealant between concrete panels.

PHOTOGRAPH 15 – View of concrete patio with cracks in the concrete. There is no joint sealant between concrete panels.

PHOTOGRAPH 16 – General view of asphalt-paved seating area on the west side of the property. Asphalt paving is in poor condition.

PHOTOGRAPH 17 – View of asphalt sidewalk that extends along the east side of the property. Pavement is in poor condition with transverse and longitudinal cracks and edge raveling.

PHOTOGRAPH 18 – View of asphalt sidewalk that extends along the east side of the property. Pavement is in poor condition with transverse and longitudinal cracks and edge raveling.
PHOTOGRAPH 19 – View of asphalt sidewalk that extends along the east side of the property. Pavement is in poor condition with transverse and longitudinal cracks and edge raveling.

PHOTOGRAPH 20 – View of granite sidewalk with cracks in the granite slabs.

PHOTOGRAPH 21 – View of granite sidewalk with possible settlement adjacent to the building column.

PHOTOGRAPH 22 – View of granite sidewalk with possible settlement of the sidewalk adjacent to the building foundation and stairs. The differential movement of the granite sidewalk has created a trip hazard which is a life-safety issue.

PHOTOGRAPH 23 – General view of granite steps.

PHOTOGRAPH 24 – View of steps from the loading dock area to the east side of the building. Steps are in fair condition.
PHOTOGRAPH 25 – View of steps on the north side of the building that extend from the building. These steps are in poor condition and have been barricaded against pedestrian traffic.

PHOTOGRAPH 26 – General view of granite and concrete steps and benches.

PHOTOGRAPH 27 – Example of concrete curb with isolated cracks.

PHOTOGRAPH 28 – General view of fencing along east property boundary. Fencing has chipped and peeling paint, surface oxidation, and possible corrosion.

PHOTOGRAPH 29 – View of fence on the top of the berm adjacent to the service drive. Fence is leaning and several of the footings appear to be undermined.

PHOTOGRAPH 30 – View of fencing on top of the berm to the west of the building. The fence is leaning and several of the footings appear to be undermined. Shoring has been installed to prevent collapse of the fence.
PHOTOGRAPH 31 – View of fencing at the northwest corner of the property. The fence is leaning and there is a section of fence that has been damaged.

PHOTOGRAPH 32 – View of probable French drain at the base of the berm.

PHOTOGRAPH 33 – View of probable French drain at the base of the berm.

PHOTOGRAPH 34 – View of light pole with surface oxidation and possible corrosion around the base of the pole.

PHOTOGRAPH 35 – General view of the canopy structure.

PHOTOGRAPH 36 – View of structural steel framing of the canopy structure. There is visible oxidation and possible corrosion of the steel.
PHOTOGRAPH 37 – View of structural steel framing of the canopy structure. There is visible oxidation and possible corrosion of the steel.

PHOTOGRAPH 38 - View of structural steel framing of the canopy structure. There is visible oxidation and possible corrosion of the steel.

PHOTOGRAPH 39 – View of structural steel framing of the canopy structure. There is visible oxidation and possible corrosion of the steel.

PHOTOGRAPH 40 – View of structural steel framing of the canopy structure. There is visible oxidation and possible corrosion of the steel.

PHOTOGRAPH 41 – Example of dented flagpole.

PHOTOGRAPH 42 – Example of flagpole with bent top.
PHOTOGRAPH 43 – View of foundation floor slab with no visible distress.

PHOTOGRAPH 44 - View of foundation floor slab with no visible distress.

PHOTOGRAPH 45 – View of the expansion joint on the third floor in Corridor 3.04. There is distress in the joint sealant.

PHOTOGRAPH 46 – Example of concrete delamination at the column above the second floor balcony.

PHOTOGRAPH 47 – Example of concrete spall with exposed rebar.

PHOTOGRAPH 48 – Example of concrete spall with exposed rebar.
PHOTOGRAPH 49 – View of roof framing with possible moisture staining.

PHOTOGRAPH 50 - View of roof framing with possible moisture staining.

PHOTOGRAPH 51 – View of second floor framing with staining that may indicate moisture infiltration.

PHOTOGRAPH 52 - View of second floor framing with staining that may indicate moisture infiltration.

PHOTOGRAPH 53 – View of expansion joint through the first floor framing with possible moisture staining and efflorescence.

PHOTOGRAPH 54 – View of second floor framing with staining that may indicate moisture infiltration.
PHOTOGRAPH 55 – View of existing modified bitumen roofing system. Granule loss and membrane alligatoring is typical in the roofing membrane.

PHOTOGRAPH 56 – View of aluminum clad base flashing at the parapet wall conditions and the thru-wall scuppers used as the secondary/overflow drainage.

PHOTOGRAPH 57 – View of the aluminum clad base flashing and the pre-finished metal expansion joints. Aluminum clad base flashings are beginning to show signs of delamination.

PHOTOGRAPH 58 – View of membrane alligatoring and membrane shrinkage in the modified bitumen roof membrane.

PHOTOGRAPH 59 – View of alligatoring and membrane shrinkage in the modified bitumen roof membrane.

PHOTOGRAPH 60 – View of the granule loss taking place in the modified bitumen roofing membrane.
PHOTOGRAPH 61 – Overview photo of typical roof penetration with aluminum clad base flashing. Also noted in photo is the presence of granule loss and membrane alligating in the modified bitumen roof membrane.

PHOTOGRAPH 62 – Ponding condition observed at the roof drains at the projection room roof area (Typical).

PHOTOGRAPH 63 – Ponding condition observed at the roof drains at the projection room roof area (Typical).

PHOTOGRAPH 64 – Where the metal wall panels are installed at the projection room, the exterior paint that appears to be installed over the galvanized metal panels is beginning to peel and flake away from the metal panels.

PHOTOGRAPH 65 – Where the metal wall panels are installed at the projection room, the exterior paint that appears to be installed over the galvanized metal panels is beginning to peel and flake away from the metal panels.

PHOTOGRAPH 66 – Where the metal wall panels are installed at the projection room, the exterior paint that appears to be installed over the galvanized metal panels is beginning to peel and flake away from the metal panels.
PHOTOGRAPH 67 – Wall panel joint condition at the pre-cast wall panels. Typical joint appears to be a masonry reveal joint that are in overall good condition.

PHOTOGRAPH 68 – Typical joint condition at the granite wall and floor panels. The joints at the granite wall and floor panels are beginning to fail and are recommended for replacement.

PHOTOGRAPH 69 – Sealant joint failure at the fountain and walkover bridge area.

PHOTOGRAPH 70 - Sealant joint failure at the fountain and walkover bridge area.

PHOTOGRAPH 71 – Example of architectural finishes. In general, the architectural finishes are in good condition.

PHOTOGRAPH 72 – Example of distress to the concrete-floor staining. This type of distress is typical for buildings of this age and was only observed at isolated locations.
PHOTOGRAPH 73 – Example of distress to the concrete-floor staining. This type of distress is typical for buildings of this age and was only observed at isolated locations.

PHOTOGRAPH 74 – View of floor in Room 1.05.17. There is damage (spalls) to the concrete floor adjacent to the sump pit.

PHOTOGRAPH 75 – View of ceramic tile in Room 3.06.02. The ceramic tile is worn and is showing signs of typical wear and tear.

PHOTOGRAPH 76 – View of damage to the interior wall. This type of distress is typical for buildings of this age and was only observed at isolated locations.

PHOTOGRAPH 77 – View of vertical crack above the door to Room 3.04.10. This type of distress is typical for buildings of this age and was only observed at isolated locations.

PHOTOGRAPH 78 – Example of vertical crack in Corridor 3.04.C4. This type of distress is typical for buildings of this age and was only observed at isolated locations.
PHOTOGRAPH 79 — General view of ceiling tiles in Room 3.08.01. There is staining around the HVAC vents which is typical for buildings of this age.

PHOTOGRAPH 80 — General view of ceiling tiles in Corridor 3.04.C4. Typical distress conditions include staining and broken or damaged tiles. This type of distress is typical for buildings of this age and was only observed at isolated locations.

PHOTOGRAPH 81 — Example of staining on the ceiling tiles.

PHOTOGRAPH 82 — View of interior stairs with spalled concrete and exposed rebar. The rebar has severe corrosion with significant loss of section. This is located in the mechanical pit with the chiller units.

PHASE I ENVIRONMENTAL ASSESSMENT REPORT
Dr. Kimberly Andrews Espy, Ph.D., Provost
Academic Affairs, MB 4.210
University of Texas, San Antonio
One UTSA Circle
San Antonio, Texas 78249

RE: Phase I Environmental Site Assessment
Institute of Texan Cultures
801 East Cesar E. Chavez Boulevard
San Antonio, Texas

Dear Dr. Espy:

Raba Kistner, Inc. (RKI) is pleased to submit the attached Phase I Environmental Site Assessment (ESA-I) report for the above-referenced property. This report was prepared for the University of Texas, San Antonio (CLIENT) and may not provide adequate information for other purposes or parties. If other parties wish to rely on this report, please have them contact us so that a mutual understanding and agreement of the terms and conditions for our services can be established prior to their use of this information. Reliance on the information provided in this ESA-I report for the purposes of conducting "All Appropriate Inquiry" (AAI) is subject to the conditions in ASTM E 1527-13 §4.6 describing the continued viability of an ESA-I.

We appreciate the opportunity to have been of professional service on this important project. Should there be any questions or additional information required, please contact our office at your earliest convenience.

Very truly yours,

RABA KISTNER, INC.

Jordan A. Rosales
Environmental Geologist

1.0 EXECUTIVE SUMMARY

As authorized by Dr. Kimberly Andrews Espy, Academic Affairs, of the University of Texas, San Antonio (CLIENT), Raba Kistner, Inc. (RKI) has completed a Phase I Environmental Site Assessment (ESA-I) for two developed tracts of property totaling approximately 12.933 acres. These tracts are currently owned by the “Board of Regents of the UT System”, and are located at 801 East Cesar E. Chavez Boulevard San Antonio, Bexar County, Texas (i.e., hereinafter referred to as the SITE). The ESA-I was conducted on behalf of The University of Texas, San Antonio in accordance with RKI Proposal Number PSR22-055-00, dated July 22, 2022, with procedures set forth in the following guidance document: American Society of Testing and Materials (ASTM) Practice E 1527-13, Environmental Site Assessments: Phase I Environmental Site Assessment Process. The limitations and exceptions of this assessment are discussed on Section 2.3 of this report.

The two parcels comprising the SITE consist of the following:

Parcel 1 is a 6.4090-acre parcel occupied by the Institute of Texan Cultures from approximately 1970 to 2022.

Parcel 2 is a 6.5240-acre parcel occupied by the Institute of Texan Cultures from approximately 1970 to 2022.

The findings, conclusions, and recommendations developed during this ESA-I are presented as follows:

- During SITE reconnaissance activities, RKI did not observe evidence of the following: bulk storage of petroleum products in underground or aboveground storage tanks (USTs/ASTs); process wastewater generation; oil or gas wells; stained soils or stressed vegetation, or other features on the SITE that would suggest potential recognized environmental condition (REC) associated with the SITE. However, RKI observed the following hazardous substances:

  RKI observed small quantities of common household cleaners were observed with the janitorial closets throughout the main building structure (i.e., Texas Pavilion building). The remnants of paints were observed in the former wood shop located within the basement of the facility. These containers were observed to be stored properly within fire-rated storage closets. Three 55-gallon drums of cooling water treatment (E-3358) and chemical treatment biocide (Bio/Tec 084, Bio/Tec 911). These drums are stored within the water cooling facility adjacent to the cooling tower east of the main building.

  Gasoline used for landscaping equipment is currently stored in small quantity containers (less than 5-gallons in size) and were observed stored within fire cabinets within the landscape maintenance shed on the southeast corner of the SITE.

  Good housekeeping practices were observed throughout the SITE’s structures. Due to the relatively small quantities of chemicals used and disposed of in accordance with the manufacturer’s guidelines, impacts to the SITE from these materials are considered unlikely.
RKI reviewed Historical Fire Insurance Maps and identified the following recognized environmental conditions:

- In a 1952 Fire Insurance Map, RKI gleaned the following information pertaining to the SITE:
  - An automotive repair shop and filling station appear at the intersection of the former Goliad Street and Newton Street which was located on the west side of the SITE. Automotive repair facilities typically utilize petroleum by-products and solvents during the course of their operations. In addition, many automotive repair facilities possess underground hydraulic lifts, which may contribute to past release(s) of hydraulic fluid to the SITE subsurface. Due to the potential for historical contamination to be present, the historic automotive repair shop constitutes REC #1 for the SITE.
  - Filling station facilities typically utilize petroleum by-products during the course of their operations. Due to potential historic hydrocarbon releases originating from the filling station operations, the historic filling station constitutes REC #2 for the SITE.
  - A dry cleaner appears on former Goliad Street located on the south side of the SITE. Dry cleaner facilities typically utilize solvents (i.e. detergent, soap, etc.) during the course of their operations. Due to potential past release(s) of solvents, impacting nearby soil and shallow groundwater, the historic dry cleaner constitutes REC #3 for the SITE.
  - A machine shop appears on Goliad Street adjacent to the former dry cleaners located near the southwest corner of the SITE. Machine shop facilities typically utilize petroleum by-products and solvents during the course of their operations. Additionally, there is potential for heavy metals contaminants to be present in the surface soils associated with machine shop operations. Due to the potential for historical contamination to be present, the historic machine shop constitutes REC #4 for the SITE.

Locations of the RECs identified in the 1952 Sanborn map are depicted on Figure 2 – Site Plan.

- Prior to the development of the current building structures, the SITE was developed with residential structures as depicted in the reviewed Sanborn Fire Insurance maps. Urban settings with a high density of structures poses a concern with respect to lead and possibly other heavy metals contaminants. Lead-based paint was likely used in conjunction with residential structures dating back to the 1900s. Therefore, it is likely that elevated lead levels, in particular, are present in surface soils throughout the SITE.

- ERIS Database Report, dated September 30, 2022, performed the environmental regulatory database search. A complete listing of databases searched is included as Attachment G. ERIS
located 123 regulatory database finding results within a mile search radius. One regulatory database finding was identified for the SITE, and two findings are located on adjacent property. This report meets the government records search requirement of ASTM E 1527 13, All Appropriate Inquiry (AAI). The following is a summary of pertinent information concerning the SITE and its adjacent properties:

- **On-SITE finding:** This finding is listed as an Emergency Response Notification System (ERNS) facility. The facility is listed as receiving an incident on November 30, 1999. The incident is detailed as asbestos and tar fumes originating from the roof remodeling work. Due to the date of the incident and the affected physical medium (ambient atmosphere, not soil or groundwater), **RKI** does not constitute this finding as a REC for the SITE.

- **The Alamodome property** addressed at 100 & 101 Montana Street located east across I-37 is registered with the Texas Commission on Environmental Quality (TCEQ) as a former industrial and hazardous waste site (i.e., Solid Waste Registration [SWR] No. 30549). Land use restrictions have been imposed as a condition of regulatory closure of SWR 30549 stipulate that any construction activities that penetrate or disturb the existing (functional) cap of landscaping soil cover or concrete pavements (i.e., the regulatory closure physical controls) are regulated by the TCEQ.

In support of Alamodome Additions and Renovations project planning efforts and due to the presence of historical contamination, **RKI** conducted an additional limited subsurface investigation (LSI) at the Alamo Dome property in conjunction with a geotechnical engineering study in May 2015. Soil samples were collected and analyzed for chemicals of concern (COCs) historically associated with the Alamodome property including total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and select heavy metal (primarily lead) contaminants. Residual heavy metal impacts are limited to the Alamo Dome property. On the basis of collective assessment findings, distance from the SITE (300 feet east) **RKI** considers impacts to the SITE from this source to be unlikely.

- **The reported Henry B. Gonzalez Convention Center** was identified within the 1971 Sanborn Fire Insurance Map and is reported within the Voluntary Cleanup Program (VCP) under a program identification number of T0391. The subject facility is addressed at 200 E. Market Street, comprising the adjacent property north and topographically upgradient of the Project Corridor. This facility historically reported soil impact from TPH, heavy metals, and SVOC. This facility received a certificate of completion following the completion of corrective action requirements in 2003. Due to the completion of corrective actions, **RKI** does not consider this finding to be a REC for the SITE.

- Based on the information reviewed, there was no evidence that the subject property is currently under federal or state environmental enforcement action. **RKI** found no evidence to suggest the subject property is subject to any environmental liens and/or activity and use limitations (AULs) that would affect the SITE from an environmental standpoint.
Based on the information developed as the result of ESA-I activities, RKI recommends a Phase II Environmental Assessment (ESA) be conducted at the SITE to establish baseline environmental conditions within the SITE, and to evaluate specific environmental concerns discussed herein pertaining to the former automotive repair shop (REC #1), the historic filling station (REC #2), the historic dry cleaner (REC #3) and the historic machine shop (REC #4). Soil and groundwater samples should be collected and tested by an accredited laboratory for a range of constituents of concern with respect to petroleum products associated with former onsite and offsite operations. This executive summary is an overview only and should not be relied upon as the sole source of the reported results without first reading the full contents of this report, including appended materials.
2.0 INTRODUCTION

2.1 Purpose

This ESA-I was conducted to inform the CLIENT (user) regarding recognized past or current uses of hazardous substances or evidence of contamination, as set forth within the scope of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (42 U.S.C. §9601), or resulting from petroleum products. The ESA-I process is generally intended to permit the user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations to CERCLA liability a.k.a. “landowner liability protections,” or “LLPs”: That is, to provide documentation that “appropriate inquiry into the previous ownership and uses of the property consistent with good commercial or customary practice” as defined in 42 USC § 9601(35)(B).

Information about the SITE regarding recognized past or current uses of hazardous substances or evidence of contaminants within the scope of CERCLA and petroleum products is reported herein and is subject to the limitations, terms, and conditions described in the following section.

2.2 Scope of Services

The ESA-I was conducted on behalf of The University of Texas at San Antonio in general accordance with procedures set forth in the following guidance document: *American Society of Testing and Materials (ASTM) Practice E 1527-13, Environmental Site Assessments: Phase I Environmental Site Assessment Process*. Specifically, the scope of work for the ESA-I included the following primary components: (1) interview with present owner representative; (2) information request from the local government (i.e., Fire Department); (3) review of historical sources of information; (4) review of federal, state, tribal, and local government records; (5) site reconnaissance by an Environmental Professional; and (6) report preparation.

2.3 Key Terms

The following key terms are utilized in this ESA-I study report and are defined in accordance with the referenced ASTM-13 guidance. These terms do not intend to include de minimis conditions that generally do not present a material risk of harm to public health or the environment, and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies.

- A recognized environmental condition (REC), as defined by ASTM, is the presence or likely presence of any hazardous substances or petroleum products on the SITE under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products in, on, or at a property.

- A controlled recognized environmental condition (CREC) is a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required land use controls, restrictions or limitations.
Project No. ASR22-032-00
October 31, 2022

- A historical recognized environmental condition (HREC) is a past release of any hazardous substances or petroleum products that has occurred in connection with the subject property and has been addressed to the satisfaction of the applicable regulatory authority. The SITE may also meet unrestricted land use criteria established by a regulatory authority, without subjecting the SITE to any required controls.

- Vapor encroachment is the likely presence of chemical of concern (COC) vapors in the vadose zone of the target property caused by the release of contaminated soil or groundwater either on or near the SITE.

2.4 Limitations, and Exceptions

In general, the ESA-I is a risk management process. It is intended to reduce environmental risk, not wholly eliminate it. RKI makes no warranty, expressed or implied, as to the accuracy or completeness of the information provided by the various governmental regulatory agencies and other referenced information sources used during this ESA-I. Other legal obligations with regard to hazardous substances or petroleum products discovered within the SITE are beyond the scope of work for this study. This ESA-I did not include environmental sampling or testing of any kind. Furthermore, the location or identification of undocumented buried tanks or concealed wastes, hidden conditions, and subsurface conditions was not conducted.

This assessment was conducted at the request of the CLIENT utilizing methods and procedures consistent with good commercial or customary practices designed to conform to industry standards. The independent conclusions represent the best professional judgment of the Environmental Professional based on the existing conditions, the information, and the data available to RKI during the course of this assignment. Factual information regarding operations, conditions, and test data provided by CLIENT, owner, or their representative has been assumed to be correct and complete.

2.5 Special Terms and Conditions

No special terms or conditions were applicable to this ESA-I report.

2.6 User Reliance and Shelf Life

This report, prepared on behalf of the University of Texas, San Antonio (CLIENT), may not provide adequate information for other parties. If other parties wish to rely on this report, please have them contact us so that a mutual understanding and agreement of the terms and conditions for our services can be established prior to their use of this information. Reliance on the information and conclusions presented in this report by any other parties is not authorized by RKI.

RKI will not extend reliance or liability on the information provided in this ESA-I report beyond ASTM E 1527’s “shelf life” requirements of one year unless an update assessment has been performed by RKI after 180 days per ASTM E 1527-13 §4.6 describing the continued viability of an ESA-I.
Due to requirements developed by the U.S. Small Business Administration (SBA) as a result of SOP50-10[5] effective April 1, 2019), RKI cannot extend reliance on the ESA-I report to the SBA or its development company loan programs (a.k.a. Certified Development Company [CDC]), should CLIENT seek funding through the SBA or its CDC under an SBA 7(a) and 504 loan program.
3.0 PROPERTY DESCRIPTION

3.1 Property Location

As depicted on the Area Location Map (Figure 1), the SITE is comprised of two developed, contiguous parcels of property located in San Antonio, Bexar County, Texas. Each parcel is addressed as follows:

Parcel 1: 801 East Cesar E. Chavez Boulevard San Antonio, Texas (6.4090 acres)
Parcel 2: 801 East Cesar E. Chavez Boulevard San Antonio, Texas (6.5240 acres)

3.2 Legal Description

According to an online search of the Bexar County Appraisal District, (https://bexar.trueautomation.com/clientdb/?cid=110/) on October 6, 2022, the SITE appears to be comprised of two developed, contiguous parcels. Combined, these parcels comprise approximately 12.933 acres. The following are the SITE legal descriptions for each of the property parcels:

Parcel 1: Property ID 535963, NCB 13814 BLK 3 LOT PT OF 12 ARB 12A
Parcel 2: Property ID 535964, NCB 13814 BLK 3 LOT E IRR 955.2 FT OF 12 & ARB 12F 1.638 AC

According to the records, SITE ownership for the parcels is reported vested in “Board of Regents of the UT System”. No environmental liens and/or activity and use limitations (AULs) are reported for the parcel/SITE in the preliminary appraisal data or the environmental regulatory database, which are provided in Section 5.3 of this ESA-I report.

3.3 Current Use of Property

At the time of the reconnaissance activities, RKI observed the SITE as the Institute of Texan Cultures. The following is a summary of the two parcels comprising the SITE;

Parcel 1 is a 6.524-acre tract of land occupied by the Texas Plaza building utilized by the Institute of Texan Cultures from approximately 1970 to the present day. This tract hosts the Institute of Texan Cultures structure, concrete fountain, stormwater drainage culvert, pedestrian walkways, and courtyard.

Parcel 2 is a 6.4090-acre tract of land occupied by numerous example buildings used as exhibits by the Institute of Texan Cultures from approximately 1970 to the present day. This tract hosts the surrounding area of the Institute of Texan Cultures and associated parking lots.

3.4 Description of Structures, Roads, or Other Improvements

The SITE was observed with structures and other improvements during reconnaissance activities as depicted on Figure 2. The following structures are categorized per parcel as follows:
Parcel 1: The Texas Pavilion building is comprised of one rectangular three-story, concrete framed building with exterior precast walls and window/door fenestrations. The ground floor mainly consists of maintenance and storage rooms with a portion of the floor space occupied by exhibits and displays. The second floor compromises the bulk of the exhibits and displays. The third floor consists of office space and archive storage. The building site includes surface-level parking, asphalt sidewalks, and an amphitheater with a steel-framed mesh canopy.

Parcel 2: The improvements within this parcel include five historical reproduction houses that serve as exhibits, asphalt sidewalks, metal maintenance/storage shed stormwater drainage culvert, and an asphalt parking lot.

Photographs taken during the SITE reconnaissance are provided as Attachment A.

3.5 Current Use of Adjacent Properties

The observed use of adjacent properties are as follows:

- **North:** Asphalt parking areas for the Tower of Americas and Henry B. Gonzales Convention Center beyond
- **East:** Interstate Highway 37 with the Alamodome beyond
- **South:** E. Cesar E. Chavez Boulevard with multi-family residential under construction beyond
- **West:** Social Security Administration building and associated asphalt parking lot

Evidence of readily observable RECs were not observed on adjacent properties during reconnaissance effort activities.
4.0 USER PROVIDED INFORMATION

The purpose of the information is to describe tasks to be performed by the user that will assist in the identification of possible recognized environmental conditions in connection with the SITE. The user is defined by ASTM E 1527-13 as The party seeking to use Practice E 1527 to complete an environmental site assessment of the property. A user may include, without limitation, a potential purchaser of the property, a potential tenant of the property, an owner of the property, a lender, or a property manager. The user has specific obligations for completing a successful application of this Practice as defined in ASTM E 1527-13 §6.0 describing the user’s responsibilities.

The ASTM E 1527-13 user questionnaire was not completed by CLIENT since this property is currently owned by the CLIENT and is not undergoing a real estate transaction.
5.0 RECORDS REVIEW

5.1 Physical Setting

This section includes a description of the physical setting of the SITE, which includes the topographic setting, soil characteristics, underlying geology, groundwater conditions, and drainage patterns at the SITE. Most of this information is provided in the ERIS Physical Setting Report included as Attachment B.

5.1.1 Topography

According to the 2013 San Antonio West and East, Texas Quadrangle United States Geological Survey (USGS) Topographic Map (Figure 3), the surface elevations of the SITE range from approximately 650 feet to 640 feet above mean sea level with an overall gentle slope southwest towards the San Antonio River. Stormwater from the SITE is collected by stormwater drains located throughout the property with drains into the City of San Antonio’s municipal separate storm sewer system (MS4). Generally, area stormwater flows towards the San Antonio River, located southwest of the SITE.

According to the Federal Emergency Management Agency (FEMA) map, the SITE is mapped within Zone X-12, which is determined to be an area of minimal flood hazard.

5.1.2 Soil Survey

According to the Bexar County Soil Survey, the primary soil series mapped on the SITE consists of the Branyon clay, 0 to 1 percent slopes (HtA). The United States Department of Agriculture National Resource Conservation Service indicates that the Branyon series consists of very deep, moderately well-drained, very slowly permeable soils that formed in calcareous clayey alluvium derived from mudstone of Pleistocene age. These nearly level to very gently sloping soils occur on treads of stream terraces on river valleys. Slope ranges from 0 to 3 percent. Although soils observed on the SITE appear to be generally consistent with the Branyon series, surface soils across the SITE are disturbed and past environmental and engineering studies have confirmed the presence of several feet of fill soils placement associated with historical construction of the Hemisfair Park area in the late 1960s.

5.1.3 Geology

According to the Revised 1982 Geologic Atlas of Texas, San Antonio Sheet, published by the Bureau of Economic Geology at The University of Texas in Austin, the surficial geologic formation beneath soil cover at the SITE and surrounding downtown San Antonio vicinity is mapped as Quaternary-age fluviatile terrace deposits (Qt). This formation typically consists of thick sequences of fluvial deposits, which are generally comprised of varying proportions of gravel, sand, silt, and clay. The Cretaceous-age Navarro Group and Marlbrook Marl (Kknm) formation underlies the Qt and generally consists of hard marine clay and clay-shale, the uppermost weathered extent of which is often comprised of tan and gray calcareous clay. As described previously, bedrock geology and soils were not observed on the SITE as it was heavily developed with impervious cover throughout.
Based on our past experience at other nearby project sites, shallow groundwater is transient and not laterally-continuous in the SITE vicinity. Where present, shallow groundwater generally is generally encountered along the upper weathered surface of the Navarro Clay Formation, at the interface with the base of overlying (Qt) fluvial deposits.

5.1.4 Groundwater Depth and Movement

Within the SITE vicinity, groundwater occurs in shallow, discontinuous or “perched” water-bearing units particularly in association with Qt stream deposits. These shallow water-bearing units are the groundwater zones most likely to be impacted by releases from UST systems or surface spills. In general, shallow groundwater tends to mimic surface topography with influence towards area streams, creeks, rivers, etc. The visible topographic of the SITE vicinity to the southwest towards the San Antonio River. According to groundwater data reviewed from past assessments conducted in the surrounding area, shallow groundwater is typically found between 13 and 19 feet below the ground surface.

According to the ERIS Physical Setting Report (Attachment B), dated September 28, 2022, a total of 806 reported findings (i.e. water supply wells, monitoring wells, and soil borings) were mapped within a one-mile search radius of the SITE. The following is a summary of the SITE’s water well and adjacent properties' environmental soil boring (ESB) findings:

One water supply well finding is located on the south portion of the SITE drilled in 1952. The well was plugged and subsequently destroyed during the construction of the Institute of Texan Cultures.

Twelve borings were identified on the north adjacent property (The Tower of Americas). The 12 ESBs appear to be a part of a single drilling effort on June 20, 2016, and June 21, 2016. These borings are further discussed in Section 5.5.2.

Three ESBs are located on the west adjacent property (The Social Security Administration parking lot). The three ESBs appear to be a part of a single drilling effort on November 6, 2012 and were subsequently plugged on February 11 - 12, 2014. These borings are further discussed in Section 5.5.3.

Two monitoring wells and one additional ESB are located on the west adjacent property (The Social Security Administration parking lot). The two monitoring wells and ESB appear to be a part of a single drilling effort on April 13 – 15, 2009 and were subsequently plugged on February 11, 2014.

Six ESBs are located on the south adjacent property (E. Cesar E. Chavez Blvd. ROW). The six ESBs appear to be a part of a single drilling effort on November 6 – 7, 2012.

An additional ESB is located within the E. Cesar E. Chavez and was drilled on December 4, 2012.

A monitoring well is located on the south adjacent property (IH-37 ROW). The monitoring well was drilled on January 21, 2013.
These environmental borings and monitoring wells are associated with different phases of redevelopment activities surrounding the SITE.

## 5.2 Historical Records

The objective of the historical record review is to develop an understanding of historical property uses and those of the surrounding area to evaluate the likelihood of REC(s) in connection with the property.

### 5.2.1 Historical Property Use

- **1938**: The SITE appears developed with numerous residential structures. Commercial structures appear on the SITE. An improved road intersects the SITE east-west. An improved road bisects the previously stated road, originating from the north adjacent property.

- **1953, 1959, and 1963**: The SITE appears as previously stated, without additional structures/features or improvements.

- **1973**: The previously stated residential and commercial structures no longer appear on the SITE. The two aforementioned improved roads no longer appear on the SITE. The Institute of Texan Cultures appears on the SITE. The SITE is improved with one large structure located at the center of the SITE, and two associated parking lots/concrete walkways located at the north and south corners of the SITE. A sidewalk appears along the west boundary of the SITE.

- **1983, 1992, 1995, 1997**: The SITE appears as previously stated, without additional structures/features or improvements.

- **2005**: A concrete fountain appears west adjacent to the Institute of Texan Cultures. A stormwater drainage culvert appears on the northeast boundary of the SITE.

- **2008**: Multiple structures associated with the Institute of Texan Cultures appear on the SITE. Four structures appear on the north portion of the SITE, and 11 structures appear on the south portion of the SITE.

- **2010**: The four aforementioned structures no longer appear on the north portion SITE.

- **2012, 2014, 2016, 2018, 2020**: The SITE appears as previously stated, without additional structures/features or improvements.

Based on the reviewed aerial photographs, findings do not constitute a REC(s) on the SITE.
5.2.2 City Directories

City directories such as R. L. Polk & Co., Morrison & Fourmy, Coles, or Criss-Cross include year-by-year listings of property occupancy by address. A summary of the ERIS City Directory Report findings (Attachment D), dated October 3, 2022, for Cesar E. Chavez Boulevard, Highway 37, and Montana Street are as follows:

The SITE’s occupant is listed as the “Institute of Texan Cultures”, addressed at 801 Cesar E. Chavez Blvd., dating back to the 1970 Cole City Directory. The SITE is not listed on city directories prior to 1970.

The north adjacent property’s occupant is listed as the “Tower of Americas”, addressed at 739 Cesar E. Chavez Blvd., dating back to the 1970 Cole City Directory. The north adjacent property is not listed on city directories prior to 1970.

The east adjacent property’s occupant is listed as the “Alamodome”, addressed at 100 Montana St., dating back to the 1996 Cole City Directory. The east adjacent property is not listed on city directories prior to 1996.

The south adjacent property, 600 Cesar E. Chavez Blvd., is not listed on the ERIS City Directory Report.

The west adjacent property’s occupant is listed as the “Social Security Administration” and “Federal Public Defender”, addressed at 727 Cesar E. Chavez Blvd., dating back to the 1978 Cole City Directory. The west adjacent property is not listed on city directories prior to 1978.

Based on the reviewed aerial photographs, findings do not constitute a REC(s) on the SITE.

5.2.3 Fire Insurance Maps

In the late nineteenth century, the Sanborn Company began preparing property usage maps for use by fire insurance companies primarily for properties located in urban and other populated areas. According to the ERIS Fire Insurance Maps Report (Attachment E) dated September 28, 2022, coverage available for the SITE includes years 1896, 1904, 1912, 1951, 1952, 1969, and 1971. The following presents descriptions of the information gleaned from each map:

1896: Multiple residential structures appear on the SITE. Goliad St. intersects the SITE east-west. Santa Clara St. intersects Goliad St. on the SITE. Newton St. bisects Goliad St. on the SITE. South St. intersects Newton St. and bisects Santa Clara St. on the SITE. Dakota St. bisects Goliad St. on the south portion of the SITE. Fountain St. bisects Goliad St. on the south corner of the SITE.

Commercial properties appearing on the Sanborn map include a “camp yard” on Goliad St. and a “drugstore” located at the intersection of Goliad St. and Santa Clara St.

1904: The SITE appears as previously stated.
1912: A “cooking school” appears at the northeast boundary of the SITE.

1951: “Baptist Temple” church appears at the intersection of South St. and Newton St. An automotive repair shop and filling station appears at the intersection of Goliad St. and Newton St. A dry cleaner appears on Goliad St. A machine shop appears on Goliad St.

1952: The SITE appears as previously stated.

1969: The aforementioned residential and commercial structures no longer appear on the SITE. The Institute of Texan Cultures structure appears on the SITE. An associated bridge and earth embankment appear adjacent to the structure.

1971: The SITE appears as previously stated.

Automotive repair facilities typically utilize petroleum by-products and solvents during the course of their operations. In addition, many automotive repair facilities possess underground hydraulic lifts, which may contribute to past release(s) of hydraulic fluid, impacting nearby soil and shallow groundwater. Additionally, there is potential for heavy metals contaminants to be present in the surface soils associated with auto-body operations. Due to the potential for historical contamination to be present, the historic automotive repair shop constitutes REC #1 for the SITE.

Filling station facilities typically utilize petroleum by-products during the course of their operations. Due to potential historic hydrocarbon releases originating from the filling station operations, the historic filling station constitutes REC #2 for the SITE.

Dry cleaner facilities typically utilize solvents (i.e. detergent, soap, etc.) during the course of their operations. Due to potential past release(s) of solvents, impacting nearby soil and shallow groundwater, the historic dry cleaner constitutes REC #3 for the SITE.

Machine shop facilities typically utilize petroleum by-products and solvents during the course of their operations. Additionally, there is potential for heavy metals contaminants to be present in the surface soils associated with machine shop operations. Due to the potential for historical contamination to be present, the historic machine shop constitutes REC #4 for the SITE.

Locations of the RECs gleaned from the 1952 Sanborn map are depicted on Figure 2.

5.2.4 Historical Topographic Maps

The Historical Topographic Maps (Attachment F) prepared by ERIS dated September 28, 2022, were taken from historical 7.5-minute series topographic maps prepared by the USGS (San Antonio East and San Antonio West, Texas Quadrangles) dated 1953, 1967, 1973, 1992, 2016, and 2019 were reviewed during this ESA-I study for historical SITE usage. Although the maps are primarily representative of topography, their map legends occasionally include structures/features on a property. The following presents a summary of information gleaned from topographic maps:
1953: A church structure appears at the center of the SITE. Three additional structures appear on the east portion of the SITE.

1967: The four aforementioned structures no longer appear on the SITE. The Institute of Texan Cultures appears at the center of the SITE.

1973: Two structures associated with the Institute of Texan Cultures appear on the north portion of the SITE.

1992: The two structures associated with the Institute of Texan Cultures no longer appear on the north portion of the SITE.

2016 and 2019: Topographic maps no longer depict structures, features, or improvements on the SITE.

The SITE and immediate surrounding area are not depicted with any map legend markings denoting potential features of environmental concern (i.e. gravel pits, landfill, or mining).

RKI did not identify any REC on the SITE’s adjacent properties after reviewing the historical aerial photographs.

5.3 Standard Environmental Records Review

The objective of the environmental regulatory agency database review is to obtain and review records that will help identify REC in connection with the property. ERIS Database Report, dated September 30, 2022, performed the environmental regulatory database search. A complete listing of databases searched is included as Attachment G. ERIS located 123 regulatory database finding results within a mile search radius. One regulatory database finding is located on the SITE, and one finding is located on adjacent properties. This report meets the government records search requirement of ASTM E 1527 13, All Appropriate Inquiry (AAI).

The following Table 2 provides an overview of the Federal Environmental Protection Agency (EPA) and State Texas Commission on Environmental Quality (TCEQ) databases searched and the AAI and Non-AAI findings within an eighth (1/8) of a mile from the SITE:

NOTES:

Federal - ASTM/AAI
Emergency Response Notification System (ERNS): The standard search radius for ERNS sites is the target property.
RCRA Non-Generators (RCRA NON-GEN): The standard search radius for RCRA NON-GEN facilities is a quarter mile from the SITE.
State - ASTM/AAI
Aboveground Petroleum Storage Tanks (AST): The standard search radius for AST facilities is one-quarter mile from the SITE.
Leaking PST (LPST): The standard search radius for LPST facilities is one-half mile from the SITE.
Underground Petroleum Storage Tanks (UST): The standard search radius for UST facilities is one-quarter mile from the SITE.
Historical Tank Construction Notification (HIST TANK): The standard search radius for HIST TANK facilities is one-quarter mile from the SITE.
State - Non-ASTM/AAI
Industrial and Hazardous Waste - Generators (IHW GENERATOR): The standard search radius for IHW GENERATOR facilities is one-eighth of a mile from the SITE.
Groundwater Contamination Cases (GWCC): The standard search radius for GWCC facilities is one-eighth of a mile from the SITE.
Inactive Regulated RCRA Generator Facilities (HIST RCRA GEN): The standard search radius for HIST RCRA GEN facilities is an eighth of a mile from the SITE.
Industrial and Hazardous Waste Sites with Corrective Actions (IHW CORR ACTION): The standard search radius for IHW CORR ACTION facilities is one mile from the SITE.
Tier 2 Report (TIER 2): The standard search radius for TIER 2 facilities is one-eighth (1/8) mile from the SITE.
One un-plottable (unable to locate) facility is listed on the ERIS Database Report. The un-plottable facility is addressed on Wyoming St. After reviewing Google Maps/Earth imagery, RKI determined Wyoming St. is approximately a quarter-mile (¼) from the SITE. Due to the distance from the SITE, RKI does not constitute this facility a potential impact to the SITE.

5.4 Additional Environmental Record Sources

During the course of this ESA-I study, RKI supplemented the standard environmental record sources by reviewing reasonably ascertainable records for the SITE and adjacent properties from the following sources:

Water Supply and Monitoring Wells: According to Texas Water Development Board’s Water Information Integration and Dissemination website at https://www3.twdb.texas.gov/apps/WaterDataInteractive/GroundwaterDataViewer/?map=sdr, no active water supply wells were identified on the SITE. This database was accessed on October 12, 2022, and is updated on a daily basis.

Oil Well, Gas Wells, and Pipelines: According to Texas Railroad Commission map records available online at https://www.rrc.texas.gov/resource-center/research/gis-viewer/, no gas or oil wells are mapped on the SITE. This database was accessed on October 12, 2022, and is updated on a daily basis. In addition, the ERIS Physical Setting Report (Attachment B) dated September 28, 2022, did not identify any oil or natural gas wells on the SITE or adjacent properties.

Other Databases: The U.S. EPA Cleanups in My Community database is available online at, no records indicating any cleanup/remediation activities for the SITE or adjacent properties were identified. This database was updated on a monthly basis and was last updated on October 12, 2022, at the time of the ESA-I reporting.

5.5 Previous Environmental Reports

RKI reviewed and summarized the following environmental reports contained within our files pertaining to studies performed for the SITE or adjacent areas. Based on information reviewed from the previous environmental studies, several findings corresponding to those discussed herein were identified within the SITE or on adjacent properties. A brief overview of salient information contained in the reviewed reports is presented as follows:

5.5.1 Affected Soils and Water Management Report Alamodome (RKI, 2017)

In support of Alamodome Additions and Renovations project planning efforts and due to the presence of historical contamination, RKI conducted a limited subsurface investigation (LSI) at the SITE in conjunction with a geotechnical engineering study in May 2015. Soil samples were collected and analyzed for chemicals of concern (COCs) historically associated with the Alamodome property including total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), and select heavy metal (primarily lead) contaminants. On the basis of collective assessment...
findings, RKI recommended special handling and management of soils and water generated during the Alamodome additions and improvements construction process.

At the conclusion of the Alamodome Additions and Renovations project earthwork/excavation activities, excess soils (including hydrocarbon-affected soils discussed in the following section and containing intermixed foundry wastes discussed in the previous subsection) were transported to and disposed of at the Waste Management Covel Gardens Landfill as Class 2 non-hazardous waste under Waste Management Profile 966943TX.

RKI concludes the Alamodome (northeast adjacent property), is not a REC to the SITE, due to the distance from the SITE, as well as previous environmental assessments indicating that the impact areas are limited to the Alamo Dome property.

5.5.2 Supplemental Environmental Assessment HBGCC South Parking Lots 1 and 2 (RKI, 2016)

According to the Supplemental Environmental Assessment (SEA), Geo Strata Environmental Consultants, Inc. (Geo Strata) previously completed Phase I (ESA-I) and Phase II Environmental Site Assessment (ESA-II) activities in 2012 and 2013, respectively, for the Market Street Realignment project on behalf of City of San Antonio Capital Improvements Management Services. The study extent for these previous investigations included land parcels corresponding to proposed Henry B Gonzales Convention Center (HBGCC) South Parking Lots 1 and 2 which are located north of the SITE. On the basis of information contained in the final ESA-II report prepared by Geo Strata (i.e., Geo Strata Project No. 815-SA-Phase II, 815-SA-Other, and 815-SA-Other-1, report dated May 2013), specific environmental concerns for the parking Lots 1 and 2 were reportedly limited to historical utilization of fill soils of unknown origin and discovery of elevated heavy metals in soil samples obtained from a single geotechnical boring installed as part of an earlier engineering study near the southern boundary of proposed HBGCC South Parking Lot 1, within the IH-37 access road.

A total of 12 spatially-distributed exploratory soil borings were installed as part of the SEA. The project activities included the screening, sampling, and chemical analysis of up to three soil samples per boring to evaluate the presence of potential COCs identified and targeted as part of the referenced previous ESA-I and ESA-II study efforts.

Collective sampling data (i.e., collected by Geo Strata and RKI) did not indicate the presence of TPH, VOC, and SVOC COCs in any of the soil samples analyzed in excess of laboratory detection limits established below applicable regulatory screening standards. In all instances, analytical testing results are consistent with field observations, as no apparent environmental impacts were observed within the planned HBGCC South Parking Lot 1 and South Parking Lot 2 area extents. PCB, organochlorine pesticide, and chlorinated herbicide analytical testing results were non-detect at appropriately established laboratory detection limits.

The majority of analytical data for RCRA 8 heavy metals constituents (i.e., obtained by Geo Strata and RKI) are below respective Texas Specific Background (TSB) values and are consistent with naturally-occurring or background values established for the State of Texas. Elevated barium, lead, and mercury with respect to TSB values are associated primarily with surface soils throughout the parking lot areas. Reported heavy metals data are in all instances below applicable Texas Risk Reduction Program (TRRP) Tier 1 PCLs defined.
by the TCEQ that are considered protective of human health in residential and commercial/industrial land use settings (and construction worker exposure).

5.5.3 Phase II Environmental Site Assessment, General Services Administration (GSA) Site (Geo Strata, 2009)

On the basis of the recommendation of the Phase I ESA previously identified, Geo Strata performed an ESA II for the Capital Improvements Management Services, Environmental Management Division of CoSA, dated November 2009 at the GSA Site to investigate the potential presence of environmental contaminants associated with the RECs identified at the site and adjacent properties. The GSA Site was described to be comprised of four parcels which include:

- 611 Indianola – Durango South Parking Lot A;
- 610 Indianola – Finesilver Parking Lot B;
- 643 E. Durango Boulevard – Woods Courthouse & Spears Training Center Property; and

For purposes of the Phase II ESA, Geo Strata described the GSA Site as three separate areas identified as:

- West Site – US Federal Courthouse and Spears Training Center;
- East Site – Federal Building and adjacent secured parking area; and
- South Site – Parking Lots A and B, south of Durango (E. Cesar E. Chavez) Boulevard.

From April 13 through 16, 2009, a total of 19 soil borings were drilled to a maximum depth of 30 feet bgs, nine of which were converted to 1-inch diameter monitor wells. The following findings and conclusions obtained from the Phase II ESA adjacent to the SITE are summarized below.

**East Site:** Geo Strata identified a cleaner (REC #3), fueling station (REC #2), and manufacturing/machinery shop (REC #4) within the area. A former auto repair facility was identified east adjacent. Borings SB-12 and SB/MW-13 indicated heavy metals impact above Tier I PCLs, with SB/MW-13 exhibiting the highest concentrations (located south). Groundwater samples from three monitoring wells were sampled prior to well development and exceeded TRRP Tier I groundwater ingestion rPCLs for heavy metals. However, after well development, all results were below PCLs. Under SPLP analysis, SB-12 and SB/MW-13 revealed lead levels exceeded TRRP Tier I groundwater ingestions rPCLs.

Following Phase II activities, Geo Strata determined that the subsurface soils, specifically at depths from 13 to 15 feet bgs (groundwater interface), exceeded TRRP Tier I rPCLs for heavy metals. Excavations to this depth were deemed difficult to conduct as delineation of the extent of contamination was not obtainable. Geo Strata recommended the owner report a release to the TCEQ and complete an Affected Property Assessment Report (APAR) to delineate the affected area with additional borings and establish TIER II calculations to determine site-specific PCLs for the metals that exceeded rPCLs. Upon completion of these activities, it was recommended that the property be evaluated for final closure.
5.5.4 Request for Designation “No Further Action At This Time”, Hemisfair Site [General Services Administration (GSA), Public Buildings Service, 2008]

Quaternary Resource Investigations, LLC (QRI) on behalf of the GSA conducted a response to the TCEQ for groundwater classification at the Hemisfair, GSA, Site. Based upon the adjustment of PCLs derived from site-specific soil and groundwater assessments data developed at the property, concentrations of COCs were ultimately determined to be below Tier I residential levels. In addition to the 19 borings installed at the property by Geo Strata in April 2009, QRI installed an additional three monitoring wells in October 2010. Salient information is as follows:

- Based on analytical data, no concentrations of VOC or TPH were detected in soil or groundwater samples.
- Concentrations of metals were all reported less than respective Tier I Residential Assessment Levels (RALs). Further groundwater samples did not contain lead, arsenic, or mercury concentrations above Class 3 Groundwater PCLs.
- GSA concluded that COCs present in soils at the subject property, do not represent a release subject to the TRRP rules.

An “Approval of Remedy Standard A – Residential” letter from the TCEQ dated May 10, 2011, stated that the subject property had achieved TRRP Remedy Standard A Residential PCLs and no further action was required.

Based on the collective assessment data reviewed it does not indicate impacts from historical spills or releases of hazardous substances, but rather isolated impacts typically encountered in any urbanized setting. Elevated metals concentrations are interpreted to represent low-level impacts associated with non-point sources attributed to anthropogenic activities (e.g., burning of fossil fuels, stormwater runoff from roadways and other urban areas, etc.). Such activities have been historically recognized throughout the downtown San Antonio area, particularly in proximity to the San Antonio River, as having resulted in the occurrence of elevated heavy metals concentrations in soils.
6.0 SITE RECONNAISSANCE

The objective of reconnaissance activities is to obtain information indicating the likelihood of identifying RECs in connection with the SITE. Brian Strye of RKI, meeting the requirements per ASTM Practice E 1527-13 for environmental professionals, conducted SITE reconnaissance activities on September 22, 2022.

6.1 Methodology and Limiting Conditions

The SITE and its perimeter were traversed by foot and the surrounding properties were observed by vehicle. RKI was accompanied by Institute of Texan Cultures personnel to provide interior access to the buildings on the SITE. RKI did not encounter SITE access limitations imposed by physical obstructions, such as adjacent buildings, bodies of water, asphalt, or other paved areas, and limiting conditions (e.g., adverse weather conditions).

6.2 General Site Setting

6.2.1 Sewage Disposal System

Sewage disposal services are provided to the SITE by the local municipal provider, San Antonio Water System (SAWS). Two sumps were observed with the basement of the Institute of Texan Cultures' mechanical rooms. These sumps are utilized to pump incoming groundwater to the on-site fountain or into the sanitary sewer system.

6.2.2 Surface Stormwater Drainage

According to the 2013 San Antonio West and East, Texas Quadrangle United States Geological Survey (USGS) Topographic Map (Figure 3), the surface elevations of the SITE range from approximately 650 feet to 640 feet above mean sea level with an overall gentle slope southwest towards the San Antonio River. Stormwater flows southwest towards the San Antonio River.

According to the Federal Emergency Management Agency (FEMA) map provided in the ERIS Physical Setting Report (Attachment B), the SITE is mapped within Zone X-12, which is determined to be outside the 100-year and 500-year floodplain, an area of minimal flood hazard.

6.2.3 Potable Water Supply

Potable water is provided to the SITE by SAWS the municipal drinking water purveyor. The sources of public water for SAWS include surface water from Canyon Lake, Lake Dunlap, Medina Lake, and groundwater from the Edwards, Carrizo, and Trinity Aquifers.

6.2.4 Surface Water

Surface water does not occur within the SITE boundaries.
6.2.5 Underground and Above Ground Storage Tanks (UST/AST)

USTs and ASTs were not observed on the SITE. RKI did not observe any remnants of the previously identified historic automotive repair shop, filling station, and/or machine shop located on the west portion of the property.

6.2.6 Odors

Strong, pungent, or noxious odors were not identified on the SITE.

6.2.7 Pools of Liquid

RKI did not observe pools of liquid on the SITE.

6.2.8 Drums

RKI observed multiple drums located adjacent to the south maintenance shed, however, the drums appeared to be empty, void of any hazardous substance. The drums appear to be used as trash container used during large festivals do not constitute a potential impact or REC to the SITE.

6.2.9 Hazardous Substance and Petroleum Products Containers

RKI observed small quantities of common household cleaners, paint cans, cooling water treatment fluid, Bio/Tec 084, Bio/Tec 911, and sulfuric acid interior to the Institute of Texan Cultures. Good housekeeping practices were observed, and no spills, leakage, or corrosion was observed associated with the aforementioned substances. These common substances do not constitute a potential impact or REC to the SITE.

6.2.10 Known or Observed Usage of Hazardous Substances

See above section.

6.2.11 Unidentified Substance Containers

RKI did not observe unidentified substance containers on the SITE during the reconnaissance.

6.2.12 Polychlorinated Biphenyls (PCBs)

Electrical transformers are a potential source of environmental concern due to the potential presence of polychlorinated biphenyls (PCBs) contained in dielectric fluids used in some units. Numerous pad-mounted transformers (PMT) were observed around the perimeter of the SITE. These transformers appeared in good condition without leakage of interior fluids or corrosion on the SITE.
6.2.13 Potential for Offsite Migration of Hazardous Materials or Petroleum Products

RKI did not observe any visual or documented evidence of migration of hazardous substances or petroleum hydrocarbons onto or from the SITE.

6.3 Interior Observations

RKI observed the interior of the Institute of Texan Cultures structure. The majority of the interior is utilized for showing-casing historic presentations of local historic cultures. Common sink and floor drains were observed in association with restroom facilities. RKI observed four elevators located within the interior of the main building. RKI observed the elevator rooms on the 3rd floor which housed the associated hydraulic reservoirs for each elevator. No leakage or hydraulic fluid was observed adjacent to these reservoirs.

RKI observed the interior of the Institute of Texan Cultures’ air-handler mechanical rooms, cooling tower mechanical room, and storage areas. Good housekeeping practices were observed throughout the interior of the structure.

RKI observed the interior of the grounds-keeping shed utilized for general maintenance/storage of the SITE.

No RECs were observed in connection to interior observations of the SITE’s structures.

6.4 Exterior Observations

6.4.1 Pits, Ponds, or Lagoons

Evidence of pits, ponds, or lagoons were not observed nor identified in connection with waste disposal or waste treatment on the SITE.

6.4.2 Stained Soils or Stressed Vegetation

RKI did not observe stained soils or stressed vegetation on the SITE.

6.4.3 Solid Waste Disposal

RKI observed three commercial dumpsters located at the northeast corner of the Institute of Texan Cultures structure. No leakage, corrosion, and/or spills were observed in association with the three commercial dumpsters. Solid waste generated from the facility is removed and disposed of by commercial vendors.

6.4.4 Process Wastewater

Process wastewater was not observed on the SITE. Historically, the facility had an operating water fountain on the west side of the property. This fountain is no longer in operation and is currently dry. Within the fountain pump room, an empty 500-gallon carboy of sodium hypochlorite and a 55-gallon
plastic drum of sulfuric acid were observed. These plastic containers were located within spill containment containers. No leakage or corrosion was associated with these containers.

6.4.5 Wells

Oil, natural gas, or domestic water supply wells were not observed on the SITE.

6.4.6 Septic Systems

RKI neither observed nor identified any onsite septic systems or cesspools.

6.4.7 Site Plan

A Site Plan is superimposed on an ESRI aerial image in Figure 2, depicting SITE conditions as observed during September 22, 2022 reconnaissance activities.
7.0 INTERVIEWS

The objective of interviews is to obtain information that may indicate RECs in connection with the SITE. This section includes information obtained from verbal discussions with individuals and organizations familiar with the SITE.

7.1 Interview with Site Owner

RKI conducted a property owner representative interview during the September 22, 2022 SITE with John DeLaffort, Facilities Manager for the University of Texas San Antonio. A brief summarization of the interview is described as follows:

Mr. DeLaffort indicated that the building a property was developed as the Institute of Texan Cultures in the 1960s. Mr. DeLaffort provided a guided tour of the facility and discussed the locations for the use and storage of hazardous materials. These areas include the basement location for the woodshop. It was indicated that the paints and thinners, glues, etc. were stored within their containers with a fire rated room with the woodshop.

Mr. DeLaffort indicated that the on-site elevators have been recently serviced with the hydraulic reservoirs located on the 3rd floor replaced. RKI visually confirmed that there was no leakage from these reservoirs. Mr. DeLaffort indicated that there are no above or underground petroleum storage tanks on the property. He indicated that there is an emergency generator on the property that is powered by natural gas.

During the site reconnaissance activities, Mr. DeLaffort confirmed that the “Old Forty” building structures are replicas and not historic. He also indicated that the landscaping services for the property are contracted and small quantities of gasoline is stored in 5-gallon containers with fire cabinets with a lawn maintenance building on the southeast side of the property. Mr. DeLaffort was not aware of any landfills on the property.

7.2 Interviews with Local Government Officials

For the sake of completeness, RKI also requested documents from the City of San Antonio via online request https://www.sanantonio.gov/opengovernment/, on October 11, 2022. As of the date on this report, no response has been received, but this is understood to mean that no additional information is contained in the City records. RKI has undertaken several past studies on behalf of the City of San Antonio and had significant interaction with staff knowledgeable regarding the past history of the surrounding Hemisfair Park. The salient information obtained from the city staff is captured in the previous environmental reports summarized herein.
8.0 FINDINGS AND CONCLUSIONS

Raba Kistner, Inc. (RKI) has completed a Phase I Environmental Site Assessment (ESA-I) for two developed tracts of property totaling approximately 12.933 acres. These tracts are currently owned by the “Board of Regents of the UT System”, and are located at 801 East Cesar E. Chavez Boulevard San Antonio, Bexar County, Texas. The findings, conclusions, and recommendations developed during this ESA-I are presented as follows:

- During SITE reconnaissance activities, RKI did not observe evidence of the following: bulk storage of petroleum products in underground or aboveground storage tanks (USTs/ASTs); process wastewater generation; oil or gas wells; stained soils or stressed vegetation, or other features on the SITE that would suggest potential recognized environmental condition (REC) associated with the SITE. However, RKI observed the following hazardous substances:

  RKI observed small quantities of common household cleaners were observed with the janitorial closets throughout the main Institute of Texan Cultures facility (Texas Pavilion). The remnants of paints were observed in the former wood shop located within the basement of the facility. These containers were observed to be stored properly within fire-rated storage closets. Three 55-gallon drums of cooling water treatment (E-3358) and chemical treatment biocide (Bio/Tec 084, Bio/Tec 911). These drums are stored within the water cooling facility adjacent to the cooling tower east of the main building.

  Gasoline used for landscaping equipment is currently stored in small quantity containers (less than 5-gallons in size) and were observed stored within fire cabinets within the landscape maintenance shed on the southeast corner of the SITE.

  Good housekeeping practices were observed throughout the SITE’s structures. Due to the relatively small quantities of chemicals used and disposed of in accordance with the manufacturer’s guidelines, impacts to the SITE from these materials are considered unlikely.

- RKI reviewed Historical Fire Insurance Maps and identified the following recognized environmental conditions:

  o In a 1952 Fire Insurance Map, RKI gleaned the following information pertaining to the SITE:

    - An automotive repair shop and filling station appear at the intersection of the former Goliad Street and Newton Street which was located on west side of the SITE. Automotive repair facilities typically utilize petroleum by-products and solvents during the course of their operations. In addition, many automotive repair facilities possess underground hydraulic lifts, which may contribute to past release(s) of hydraulic fluid to the SITE subsurface. Due to the potential for historical contamination to be present, the historic automotive repair shop constitutes REC #1 for the SITE.
Filling station facilities typically utilize petroleum by-products during the course of their operations. Additionally, there is potential for heavy metals contaminants to be present in the surface soils associated with filling station operations. Due to potential historic hydrocarbon release and heavy metals originating from the filling station operations, the historic filling station constitutes REC #2 for the SITE.

- A dry cleaner appears on former Goliad Street located on the south side of the SITE. Dry cleaner facilities typically utilize solvents (i.e. detergent, soap, etc.) during the course of their operations. Due to potential past release(s) of solvents, impacting nearby soil and shallow groundwater, the historic dry cleaner constitutes REC #3 for the SITE.

- A machine shop appears on Goliad Street adjacent to the former dry cleaners located near the southwest corner of the SITE. Machine shop facilities typically utilize petroleum by-products and solvents during the course of their operations. Additionally, there is potential for heavy metals contaminants to be present in the surface soils associated with machine shop operations. Due to the potential for historical contamination to be present, the historic machine shop constitutes REC #4 for the SITE.

Locations of the REC s identified in the 1952 Sanborn map are depicted on Figure 2.

- Prior to the development of the Institute of Texan Cultures, the SITE was developed with residential structures as depicted in the reviewed Sanborn Fire Insurance maps. Urban settings with a high density of structures poses a concern with respect to lead and possibly other heavy metals contaminants. Lead-based paint was likely used in conjunction with residential structures dating back to the 1900s. Therefore, it is likely that elevated lead levels, in particular, are present in surface soils throughout the SITE.

- ERIS Database Report, dated September 30, 2022, performed the environmental regulatory database search. A complete listing of databases searched is included as Attachment G. ERIS located 123 regulatory database finding results within a mile search radius. One regulatory database finding was identified for the SITE, and two findings are located on adjacent property. This report meets the government records search requirement of ASTM E 1527 13, All Appropriate Inquiry (AAI). The following is a summary of pertinent information concerning the SITE and its adjacent properties:
  - On-SITE finding: This finding is listed as an Emergency Response Notification System (ERNS) facility. The facility is listed as receiving an incident on November 30, 1999. The incident is detailed as asbestos and tar fumes originating from the roof remodeling work. Due to the date of the incident and the affected physical medium (ambient atmosphere, not soil or groundwater), RKI does not constitute this finding to be a REC for the SITE.
  - The Alamodome property addressed at 100 & 101 Montana Street located east across I-37 is registered with the TCEQ as a former industrial and hazardous waste site (i.e., Solid
Waste Registration [SWR] No. 30549). Land use restrictions have been imposed as a condition of regulatory closure of SWR 30549 stipulate that any construction activities that penetrate or disturb the existing (functional) cap of landscaping soil cover or concrete pavements (i.e., the regulatory closure physical controls) are regulated by the TCEQ.

In support of Alamodome Additions and Renovations project planning efforts and due to the presence of historical contamination, RKI conducted an additional LSI at the Alamodome property in conjunction with a geotechnical engineering study in May 2015. Soil samples were collected and analyzed for COCs historically associated with the Alamodome property including TPH, VOCs, SVOCs, and select heavy metal (primarily lead) contaminants. Residual heavy metal impacts are limited to the Alamo Dome property. On the basis of collective assessment findings, distance from the SITE (300 feet east) RKI considers impacts to the SITE from this source to be unlikely.

- The reported Henry B. Gonzalez Convention Center was identified within the 1971 Sanborn Fire Insurance Map and is reported within the Voluntary Cleanup Program (VCP) under a program identification number of T0391. The subject facility is addressed at 200 E. Market Street, comprising the adjacent property north and topographically upgradient of the Project Corridor. This facility historically reported soil impact from TPH, heavy metals, and SVOC. This facility received a certificate of completion following the completion of corrective action requirements in 2003. Due to the completion of corrective actions, RKI does not consider this finding to be a REC for the SITE.

- Based on the information reviewed, there was no evidence that the subject property is currently under federal or state environmental enforcement action. RKI found no evidence to suggest the subject property is subject to any environmental liens and/or activity and use limitations (AULs) that would affect the SITE from an environmental standpoint.
9.0 RECOMMENDATIONS

Based on the information developed as the result of ESA-I activities, RKI recommends a Phase II Environmental Assessment (ESA) be conducted at the SITE to establish baseline environmental conditions within the SITE, and to evaluate specific environmental concerns discussed herein pertaining to the former automotive repair shop (REC #1), the historic filling station (REC #2), the historic dry cleaner (REC #3) and the historic machine shop (REC #4). Soil and groundwater samples should be collected and tested by an accredited laboratory for a range of constituents of concern with respect to petroleum products associated with former onsite and offsite operations. This executive summary is an overview only and should not be relied upon as the sole source of the reported results without first reading the full contents of this report, including appended materials.
10.0 DATA GAPS

A data gap per ASTM E 1527-13 constitutes a lack of or inability to obtain information required by the ESA-I process despite good faith efforts by the Environmental Professional to gather such information. Based on the information reviewed including, regulatory database report, historical aerials photographs, topographic maps, previous environmental reports, and interviews no significant data gaps were encountered as part of this ESA-I study.
11.0 NON-SCOPE CONSIDERATIONS

Non-scope considerations (i.e., air quality, asbestos, cultural resources, mold, lead-based paint, waters of the U.S., etc.) per ASTM Standard E 1527-13 §13.1.5 were not addressed as part of this ESA-1 study effort.
12.0 REFERENCES

The following documents, maps, or other publications may have been utilized specifically in the preparation of this Phase I Environmental Site Assessment report or generally in the development of the report format. References to specific documents are also provided in appropriate sections of this report.

13.0 ENVIRONMENTAL PROFESSIONAL STATEMENT

The environmental professionals that performed the ESA-I declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312, and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the SITE. We have developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.
14.0 PROFESSIONAL QUALIFICATIONS AND SIGNATURE PAGE

RKI is a multi-disciplined engineering and consulting firm with over forty years of experience in the areas of environmental assessments, environmental audits, hazardous waste site restoration, environmental compliance and permitting, geological assessments, geotechnical evaluations, petroleum storage tank site monitoring and remediation, and wastewater monitoring. RKI has been involved with thousands of environmental assessments and remediation projects throughout Texas.

Jordan A. Rosales was the Environmental Professional that performed this ESA-I and Brian D. Strye provided peer review. Mr. Rosales earned a Bachelor of Science degree in Geology from Texas A&M University. Mr. Rosales is trained in soil and gas monitoring, as well as soil and groundwater sampling. Mr. Strye earned a Bachelor of Science degree in 1996 and a Master of Science in Environmental Science in 2001. Since his employment at RKI, Mr. Strye has accumulated over twenty years of experience in the environmental discipline and has been responsible for performing and overseeing ESA projects for over 20 years.

The environmental professionals that performed this ESA-I represent that, to the best of their knowledge, the statements and facts in this ESA-I are true and correct and, to the best of the assessor’s knowledge, no material facts have been suppressed or misstated.

PHYSICAL SETTING REPORT
The ERIS Physical Setting Report - PSR provides comprehensive information about the physical setting around a site and includes a complete overview of topography and surface topology, in addition to hydrologic, geologic and soil characteristics. The location and detailed attributes of oil and gas wells, water wells, public water systems and radon are also included for review.

The compilation of both physical characteristics of a site and additional attribute data is useful in assessing the impact of migration of contaminants and subsequent impact on soils and groundwater.

Disclaimer

This Report does not provide a full environmental evaluation for the site or adjacent properties. Please see the terms and disclaimer at the end of the Report for greater detail.

### Map Unit HtB - Branyon clay, 1 to 3 percent slopes

**Component: Branyon (85%)**

The Branyon component makes up 85 percent of the map unit. Slopes are 1 to 3 percent. This component is on circular gilgai on stream terraces on river valleys. The parent material consists of calcareous clayey alluvium derived from mudstone of Pleistocene age. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is very high. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the R086AY011TX Southern Blackland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 9 percent. There are no saline horizons within 30 inches of the soil surface. The soil has a maximum sodium adsorption ratio of 1 within 30 inches of the soil surface.

**Component: Houston Black (5%)**

Generated brief soil descriptions are created for major soil components. The Houston Black soil is a minor component.

**Component: Burleson (5%)**

Generated brief soil descriptions are created for major soil components. The Burleson soil is a minor component.

**Component: Lewisville (5%)**

Generated brief soil descriptions are created for major soil components. The Lewisville soil is a minor component.

### Map Unit HuC (38.79%)

**Map Unit Name:** Houston Black gravelly clay, 3 to 5 percent slopes  
**Bedrock Depth - Min:**  
**Watertable Depth - Annual Min:**  
**Drainage Class - Dominant:** Moderately well drained  
**Hydrologic Group - Dominant:** D - Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

### Map Unit HuC - Houston Black gravelly clay, 3 to 5 percent slopes

**Component: Houston Black (90%)**

The Houston Black component makes up 90 percent of the map unit. Slopes are 3 to 5 percent. This component is on circular gilgai on stream terraces on river valleys. The parent material consists of calcareous clayey alluvium derived from mudstone of Pleistocene age. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is very high. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 2 percent. This component is in the R086AY011TX Southern Blackland ecological site. Nonirrigated land capability classification is 2e. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 9 percent. There are no saline horizons within 30 inches of the soil surface. The soil has a maximum sodium adsorption ratio of 1 within 30 inches of the soil surface.
Component Description:

Minor map unit components are excluded from this report.

Map Unit: HuC - Houston Black gravelly clay, 3 to 5 percent slopes

Component: Houston Black (90%)
The Houston Black component makes up 90 percent of the map unit. Slopes are 3 to 5 percent. This component is on linear gilgai on ridges on dissected plains. The parent material consists of clayey residuum weathered from calcareous mudstone of Upper Cretaceous Age. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is very high. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 3 percent. This component is in the R086AY011TX Southern Blackland ecological site. Nonirrigated land capability classification is 3e. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 25 percent. There are no saline horizons within 30 inches of the soil surface.

Component: Heiden (5%)
Generated brief soil descriptions are created for major soil components. The Heiden soil is a minor component.

Component: Houston Black (5%)
Generated brief soil descriptions are created for major soil components. The Houston Black soil is a minor component.

Map Unit Tf (31.12%)

Map Unit Name: Tinn and Frio soils, 0 to 1 percent slopes, frequently flooded

Bedrock Depth - Min:

Watertable Depth - Annual Min:

Drainage Class - Dominant: Moderately well drained

Hydrologic Group - Dominant: D - Soils in this group have high runoff potential when thoroughly wet. Water movement through the soil is restricted or very restricted.

Major components are printed below

Tinn(70%)
- horizon A(0cm to 46cm) Clay
- horizon Bss(46cm to 183cm) Clay
- horizon Bkssy(183cm to 203cm) Clay

Frio(30%)
- horizon A1(0cm to 56cm) Clay loam
- horizon A2(56cm to 102cm) Silty clay loam
- horizon Bk(102cm to 203cm) Silty clay

Component Description:

Minor map unit components are excluded from this report.

Map Unit: Tf - Tinn and Frio soils, 0 to 1 percent slopes, frequently flooded

Component: Tinn (70%)
The Tinn component makes up 70 percent of the map unit. Slopes are 0 to 1 percent. This component is on circular gilgai on flood plains on dissected plains. The parent material consists of calcareous clayey alluvium. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is very high. This soil is frequently flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 3 percent. This component is in the R086AY013TX Clayey Bottomland ecological site. Nonirrigated land capability classification is 5w. Irrigated land capability classification is 5w. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 15 percent. There are no saline horizons within 30 inches of the soil surface.

Component: Frio (30%)
The Frio component makes up 30 percent of the map unit. Slopes are 0 to 1 percent. This component is on flood plains on dissected plains. The parent material consists of calcareous loamy and/or clayey alluvium. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately low. Available water to a depth of 60 inches (or restricted depth) is high. Shrink-swell potential is high. This soil is frequently flooded. It is not ponded. There...
Soil Information

is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 3 percent. This component is in the R086AY012TX Loamy Bottomland ecological site. Nonirrigated land capability classification is 5w. Irrigated land capability classification is 5w. This soil does not meet hydric criteria. The calcium carbonate equivalent within 40 inches, typically, does not exceed 30 percent. There are no saline horizons within 30 inches of the soil surface.

Company Name: Select Drilling Services, LLC.
Original Company Name: Select Drilling Services, LLC.
Plugging Method: Pour in 3/8 bentonite chips when standing water in well is less than 100 feet depth, cement top 2 feet
Comments: Left boring open over night to see if it would make water. No water was made and boring was plugged.
